

# *Transversity results from COMPASS*

*Horst Fischer  
Universität Freiburg*

*on behalf of the  
COMPASS Collaboration*

**DIS2006**

**XIV International Workshop  
on Deep Inelastic Scattering**

**20/April/2006 - 24/April/2006**

*Single Hadrons*

*Hadron Pairs*

*$\Lambda$  Polarization*

# Physics Goals of COMPASS

*Contribute to the understanding of the non-perturbative physics of the nucleon*

## nucleon spin structure

- Gluon Polarization  $\Delta G/G$
- transverse spin structure function  $h_1(x)$
- Sivers distribution function
- Flavor dependent polarized quark helicity densities  $\Delta q(x)$
- spin dependent fragmentation functions  $\Delta D_q^A$
- Diffractive VM-Production

## nucleon spectroscopy

- Primakoff-Reactions
  - polarizability of  $\pi$  and K
- glueballs and hybrids
- charmed mesons and baryons
  - semi-leptonic decays
  - double-charmed baryons

# The COMPASS Spectrometer @ CERN

**Beam:**  $2 \cdot 10^8 \mu^+/\text{spill}$  (4.8s/16.2s)

luminosity:  $\sim 5 \cdot 10^{32} \text{ cm}^{-2} \text{ s}^{-1}$   
 momentum: 160 GeV/c  
 polarization: -76%

# The polarized ${}^6\text{LiD}$ -Target

4 possible spin combinations:

${}^3\text{He}$  -  ${}^4\text{He}$  Dilution refrigerator ( $T \sim 50\text{mK}$ )

superconductive Solenoid (2.5 T) Dipole (0.5 T)

two 60 cm long Target-Containers with opposite polarization

During data taking for transversity dipole field always  $\uparrow$

Relaxation time  $> 2000$  hrs

reversed every 8 hours

For transversity:

reversed once a week

Polarization: 50%  
Dilution factor: 0.38

# Transverse Quark Polarizations (1)

3 distribution functions are necessary to describe the spin structure of the nucleon at LO:

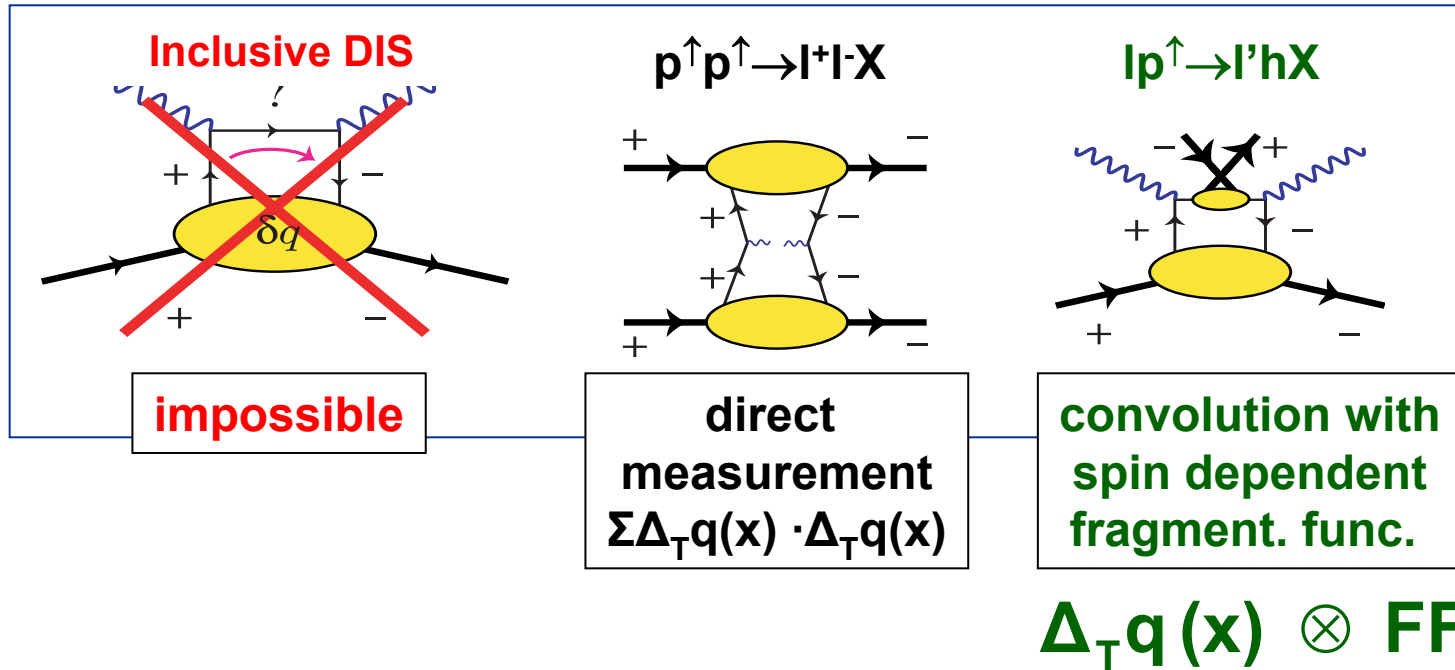

All of equal importance!

$h_1(x)$  decouples from leading twist DIS because helicity of quark must flip  
 No mixture with Gluons in evolution  
 - Valence like behavior

# Transverse Quark Polarizations (2)

For DIS three possible quark polarimeters suggested:

- ➡ Azimuthal distribution of leading  $\pi$  ← Results!
- ➡ Azimuthal dependence of the plane containing leading & next to leading hadrons ← Results!
- ➡ Measure transverse polarization of  $\Lambda$  ← Results!

# Data Sample

- ▶ Data taking with transversely polarized  ${}^6\text{LiD}$  Target during 5 periods distributed over 3 years

Year	Days data taking	DIS Events
2002	19	$1.6 \cdot 10^6$
2003	14	$3.2 \cdot 10^6$
2004	14	$6.3 \cdot 10^6$

- ▶ Trigger upgrade
  - $x_{Bj}$ ,  $Q^2$  acceptance enlarged
- ▶ PID
  - ECAL, RICH

# *DIS Single-Hadron Event Analyses*

- *Leading Hadrons only*
- *All Hadrons*

# Single hadron production

## Two possible azimuthal asymmetries:

(a) fragmentation of transversely polarized quarks with finite transverse momentum to unpolarized hadrons

→ **Collins effect (access to transversity)**

(b) modulation of transverse momentum of unpolarized quarks in the transverse polarized nucleon

→ **Sivers effect**

**Collins:**

$$A_{Coll} = \frac{A_{UT}^{\sin\Phi_{Coll}}}{D_{NN} \cdot f \cdot P} = \frac{\sum_a e_a^2 \cdot \Delta_T q_a \cdot \Delta D_a^h}{\sum_a e_a^2 \cdot q_a \cdot D_a^h}$$

**Sivers:**

$$A_{Siv} = \frac{A_{UT}^{\sin\Phi_{Siv}}}{f \cdot P} = \frac{\sum_a e_a^2 \cdot f_{1T a}^\perp \cdot D_a^h}{\sum_a e_a^2 \cdot q_a \cdot D_a^h}$$

**f** dilution factor; **P** target polarization;  $D_{NN} = (1-y)/(1-y+y^2/2)$  Depolarization factor

# The Coordinate System

Collins and Sivers terms in SIDIS cross-section depend on separate angles  $\Rightarrow$  distinguishable

**Collins:**  $A_{\text{Coll}} \sim \sin \phi_{\text{Coll}}$

$$\phi_{\text{Coll}} = \phi_h - \phi_{S'} = \phi_h + \phi_S - \pi$$

**Sivers:**  $A_{\text{Siv}} \sim \sin \phi_{\text{Siv}}$

$$\phi_{\text{Siv}} = \phi_h - \phi_S$$

$\phi_S$  = azimuthal angle of spin vector of **initial-state** quark/nucleon

$\phi_{S'}$  = azimuthal angle of spin vector of **fragmenting** quark  
with  $\phi_{S'} = \pi - \phi_S$  (*spin flip*)

$\phi_h$  = azimuthal angle of hadron momentum

# Event selection (1)

- Primary vertex with identified  $\mu$ ,  $\mu'$  & hadron

Cuts on  $\mu'$  based on kinematics:

- $Q^2 > 1 \text{ (GeV/c)}^2$

- $0.1 < y < 0.9$

- $W > 5 \text{ GeV/c}^2$

# Event selection (2)

## Leading hadron selection:

- energy deposit in hadron calorimeters  $> 5 \text{ GeV}$  (HCAL 1)  
 $> 8 \text{ GeV}$  (HCAL 2)
- Penetration  $< 10 X_0$

## Cuts on leading hadrons based on kinematics:

•  $p_T > 0.1 \text{ GeV}/c$

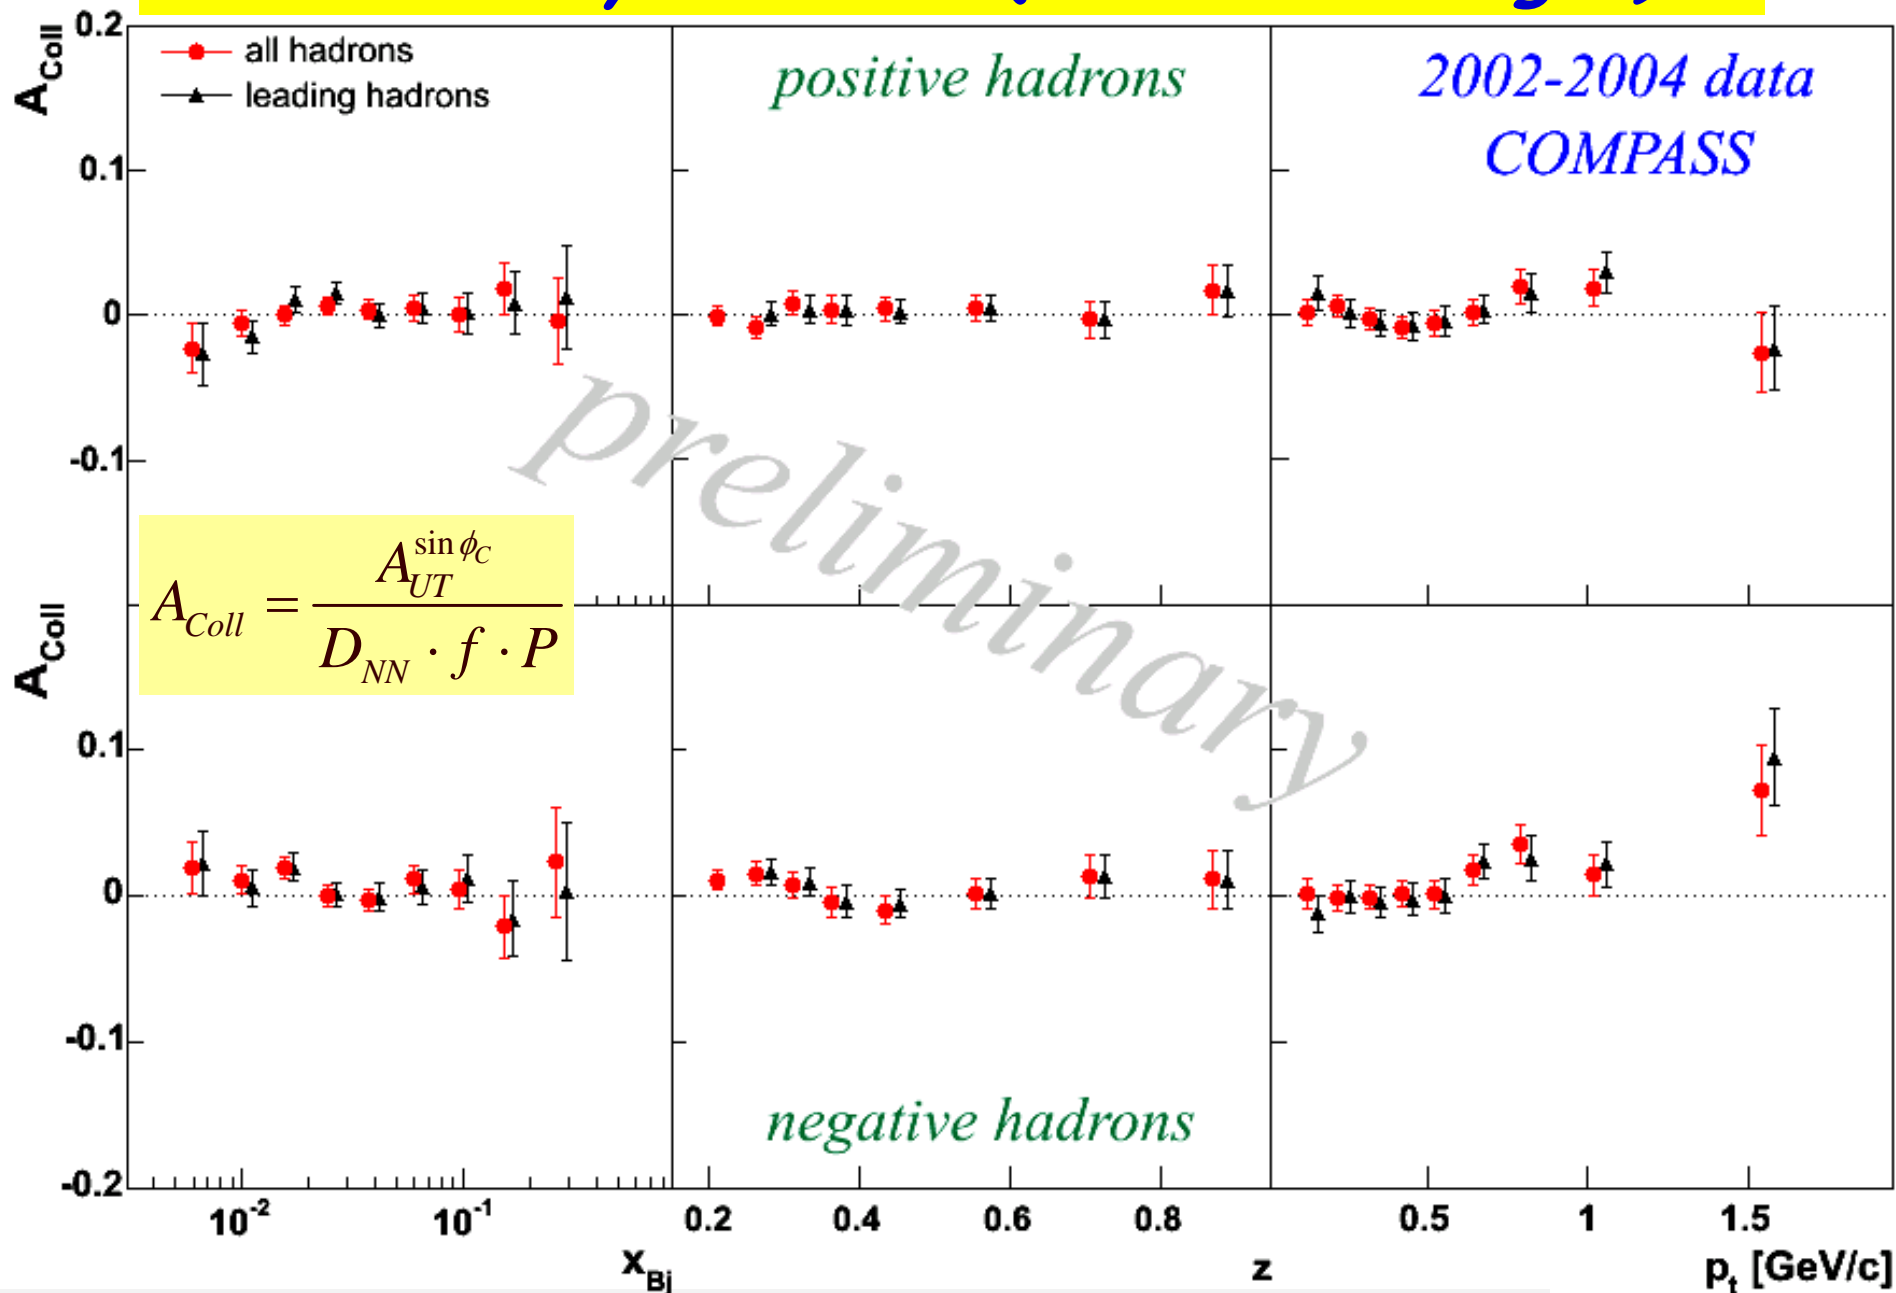

•  $z > 0.25$

•  $z_{lh} > 1 - \sum z_i$

## Final sample

# Collins-Asymmetries (Deuteron Target)

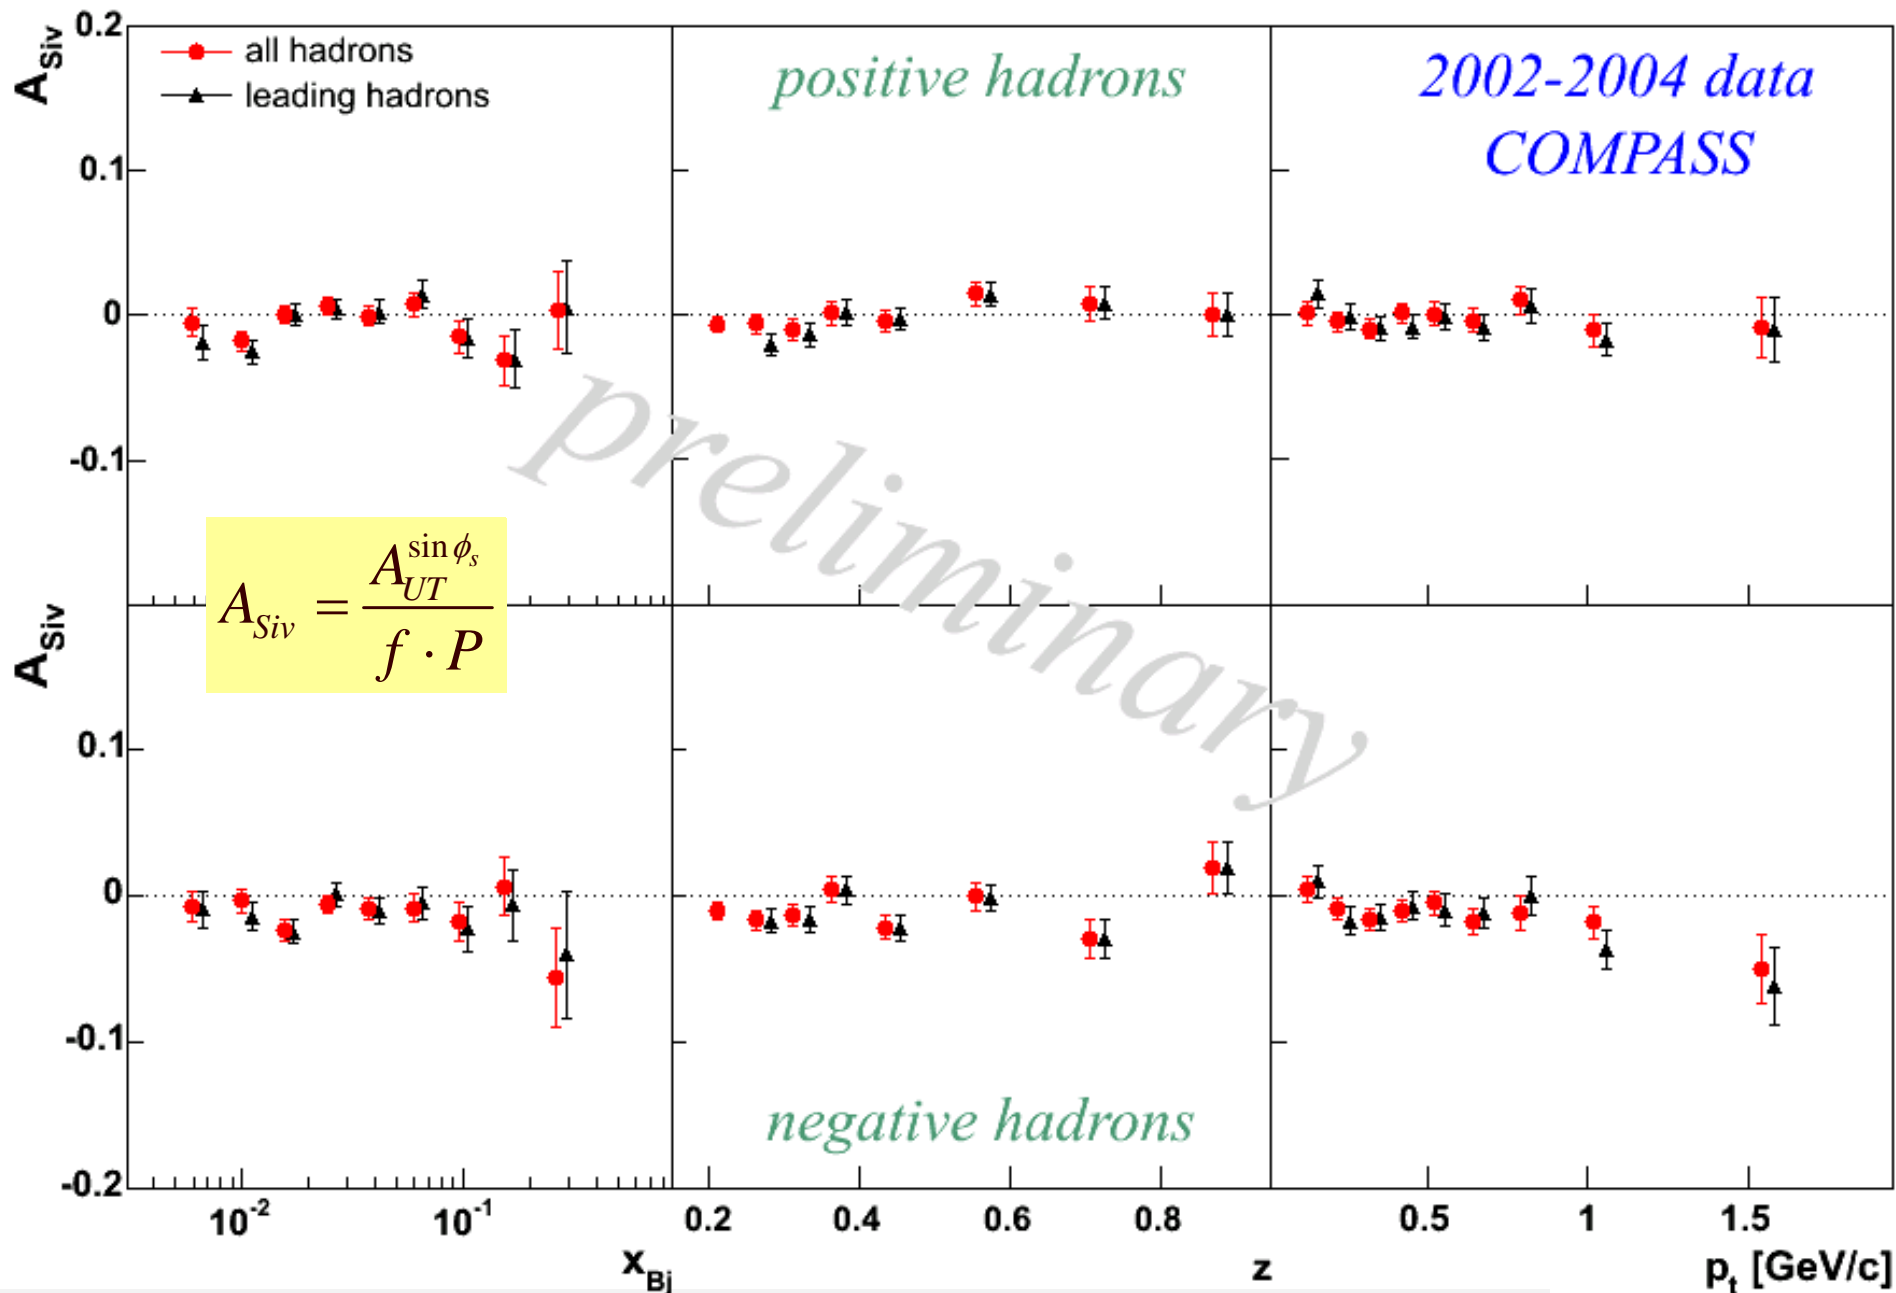

Systematic errors are considerable smaller than the quoted statistical errors

# Collins-Asymmetries (Deuteron Target)

Systematic errors are considerable smaller than the quoted statistical errors

# Sivers-Asymmetries (Deuteron Target)

Systematic errors are considerable smaller than the quoted statistical errors

# Sivers-Asymmetries (Deuteron Target)

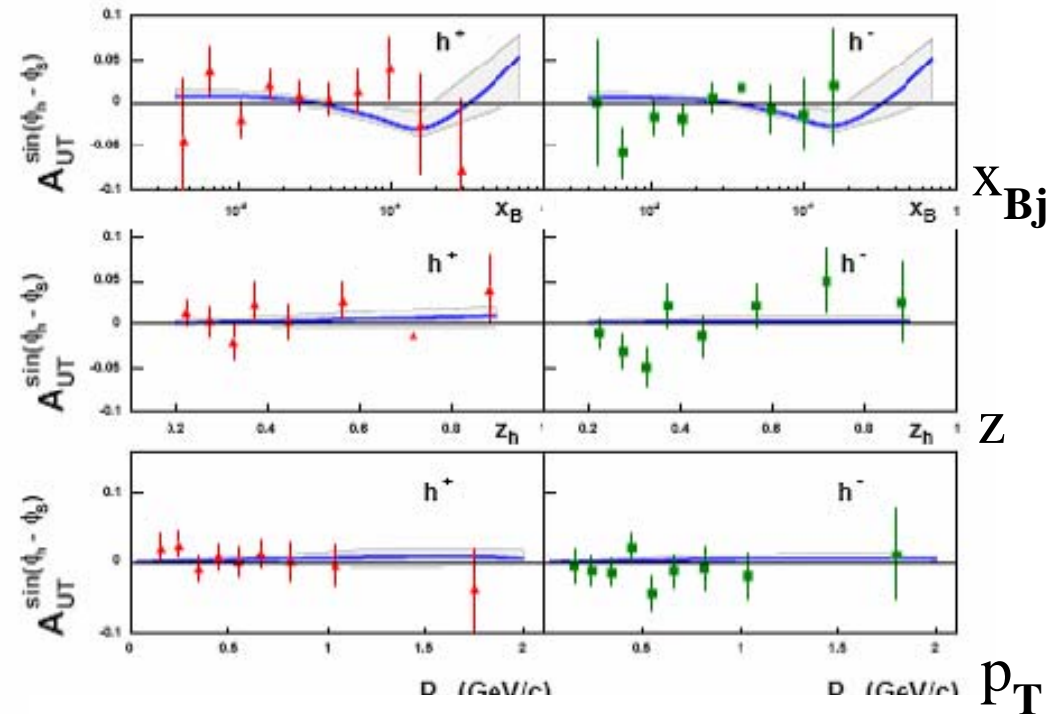

Systematic errors are considerable smaller than the quoted statistical errors

# Comparison to Theory

## Sivers from Deuterium

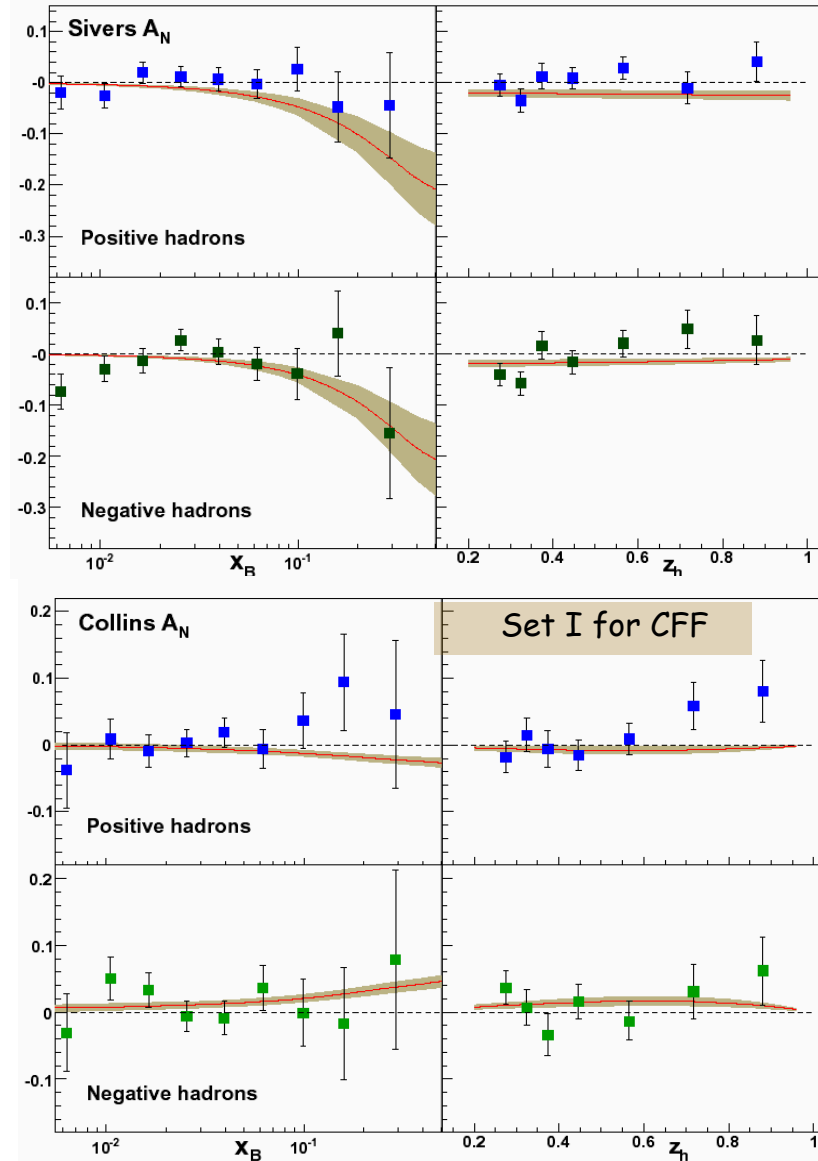

M. Anselmino et al. (hep-ph/0507181)

- Phenomenological model (hep-ph/0507181)  
- parameters are constrained by HERMES proton measurements
- COMPASS results for Sivers effect are in agreement with the model

## Collins from Deuterium

W. Vogelsang and F. Yuan (hep-ph/0507266)

# *DIS Events with Hadron-Pairs*

# The Coordinate System

Breit frame, where

- $z$  is the virtual photon direction
- the  $x$ - $z$  plane is the lepton scattering plane

$\phi_{S'}$  = azimuthal angle of spin vector of **fragmenting** quark with  $\phi_{S'} = \pi - \phi_S$  (spin flip)

$\phi_R$  = is defined by:

$$\cos \phi_R = \frac{(\mathbf{q} \times \mathbf{l}) \cdot (\mathbf{q} \times \mathbf{R}_T)}{|\mathbf{q} \times \mathbf{l}| |\mathbf{q} \times \mathbf{R}_T|}$$

$$\sin \phi_R = \frac{(\mathbf{l} \times \mathbf{R}_T) \cdot \mathbf{q}}{|\mathbf{q} \times \mathbf{l}| |\mathbf{q} \times \mathbf{R}_T|}$$

$$\phi_{RS} = \phi_R - \phi_{S'} = \phi_R + \phi_S - \pi$$

$$\begin{aligned} \mathbf{P}_h &= \mathbf{P}_1 + \mathbf{P}_2 \\ \mathbf{R} &= (\mathbf{P}_1 - \mathbf{P}_2)/2 \\ \mathbf{R}_T &= \mathbf{R} \perp \mathbf{P}_h \end{aligned}$$

# Selection of Hadron Pairs

Select all combinations of  $h^+$  and  $h^-$  hadrons with:

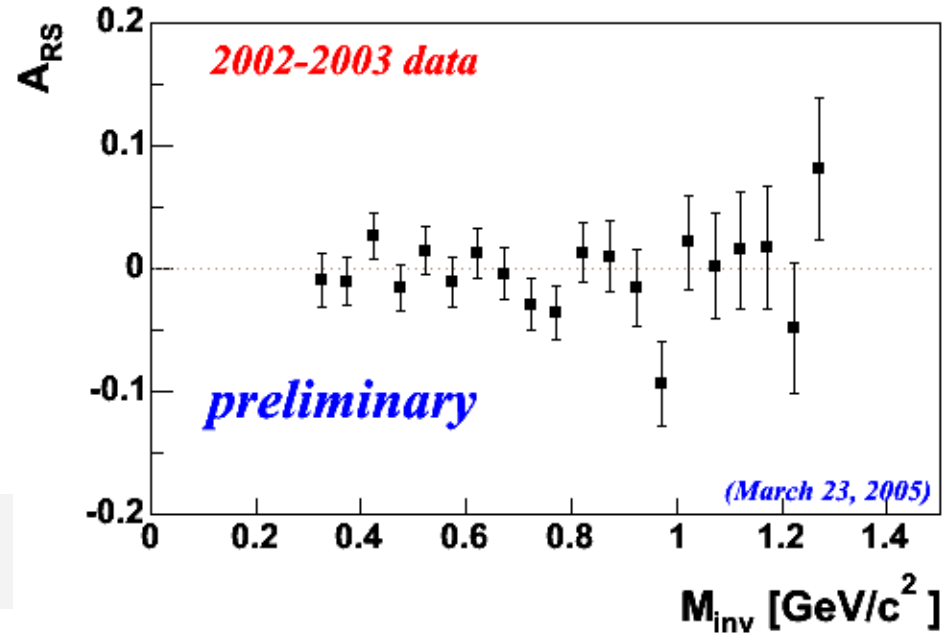

- $z_1 > 0.1$  &  $z_2 > 0.1$  and  $x_{f1} > 0.1$  &  $x_{f2} > 0.1$
- $z = z_1 + z_2 < 0.9$

# Two-Hadron Asymmetries

$$A_{RS} = \frac{A_{UT}^{\sin\phi_{RS}}}{D_{NN} \cdot f \cdot P}$$

Systematic errors are smaller than the quoted statistical errors

# Interference Fragmentation Function $H_q^{\star h}(z, M_h^2)$

One model

...

**R. L. Jaffe, X. Jin and J. Tang,  
Phys. Rev. Lett. 80, 1166 (1998)**

$$H_q^{\star}(z, M_{\pi^+\pi^-}^2) \sim \sin\delta_0 \sin\delta_1 \sin(\delta_0 - \delta_1) H_q^{\star}(z, M_{\pi^+\pi^-}^2)$$

# Interference Fragmentation Function $H_q^{\star h}(z, M_h^2)$

One model

R. L. Jaffe, X. Jin and J. Tang,  
Phys. Rev. Lett. 80, 1166 (1998)

$$H^{\star}(z, M_{\pi^+\pi^-}^2) \sim \sin\delta_0 \sin\delta_1 \sin(\delta_0 - \delta_1) H^{\star}(z, M_{\pi^+\pi^-}^2)$$

...

Another model !

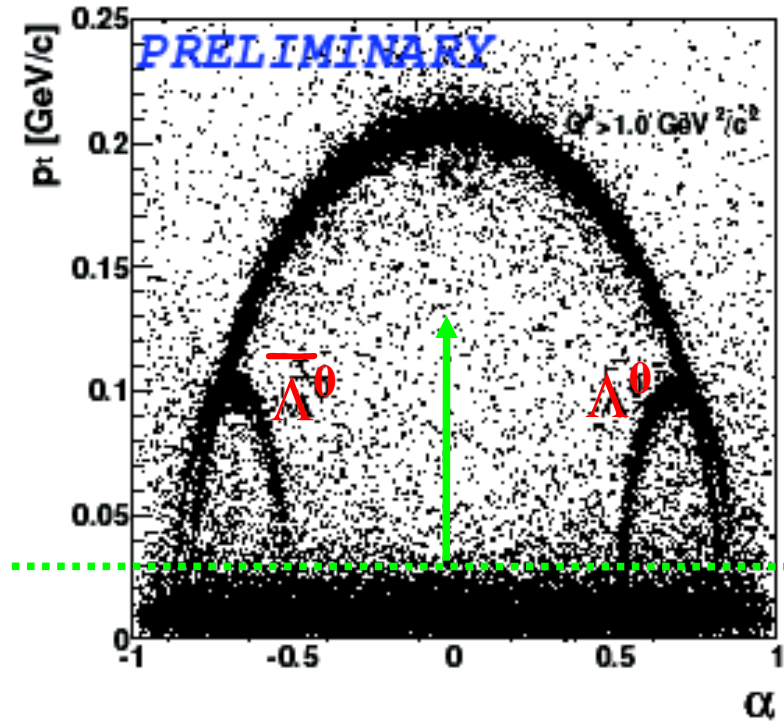

Radici, Jakob, Bianconi, PRD 65, 074031

*DIS Events with  $\Lambda$*

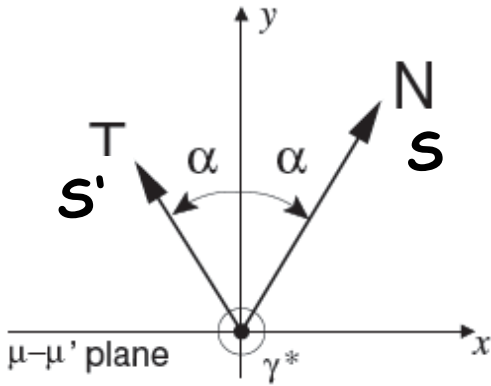

# Event selection

- Momentum of both decay particles  $> 1 \text{ GeV}/c$
- Collinearity  $< 10 \text{ mrad}$
- Decay vertex outside of the target
- Armenteros  $p_T > 23 \text{ MeV}/c$

Mostly current fragmentation !

# $\Lambda$ from scattering off Deuteron

$$P_{T,exp}^{\Lambda} = \frac{d\sigma^{\mu N^{\uparrow} \rightarrow \mu' \Lambda^{\uparrow} X} - d\sigma^{\mu N^{\downarrow} \rightarrow \mu' \Lambda^{\uparrow} X}}{d\sigma^{\mu N^{\uparrow} \rightarrow \mu' \Lambda^{\uparrow} X} + d\sigma^{\mu N^{\downarrow} \rightarrow \mu' \Lambda^{\uparrow} X}}$$

$$= f P_N D(y) \frac{\sum_q e_q^2 \Delta_T q(x) \Delta_T D_{\Lambda/q}(z)}{\sum_q e_q^2 q(x) D_{\Lambda/q}(z)}$$

$$\Delta_T D_{\Lambda/q}(z) = D_{\Lambda^{\uparrow}/q^{\uparrow}}(z) - D_{\Lambda^{\downarrow}/q^{\uparrow}}(z)$$

- ✘ Negative trend, but no significant deviation from zero
- ✘ Systematic effects not larger than statistical errors

# Summary & Outlook

- COMPASS has produced transverse spin asymmetries the deuteron

- Collins asymmetries for
  - single hadron
  - two-hadron asymmetries
    - all pairs
    - leading pairs
  - $\Lambda$  polarization
- Sivers asymmetries for single hadron

- All analyzed data, so far, indicate small Asymmetries

- cancellation of proton & neutron?

- Next steps:

- extracting asymmetries including PID information
- Hadron-pair and  $\Lambda$  analysis on 2004 data ongoing → double event sample
- Measurements with transversely polarized proton target planned
- 2006 enlarged  $x_{Bj}$  acceptance with new target magnet
