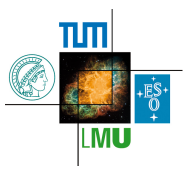
11th International Workshop on Meson Production, Properties and Interaction
KRAKÓW, POLAND
10 - 15 June 2010

supported by: Maier-Leibnitz-Labor der TU und LMU München,

Excellenzcluster: Origin and Structure of the Universe, BMBF



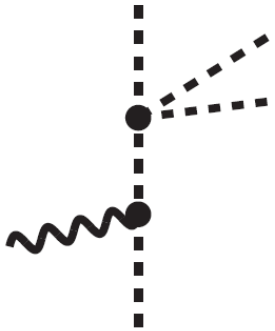
Outline

Meson Spectroscopy at Low Momentum Transfer

Motivation for Analysis

Meson spectrum at low momentum transfer

- Two production mechanisms
- $a_2(1320)$ resonance in detail:
  - in photon-pion process $\longrightarrow \Gamma(a_2(1320) \longrightarrow \pi\gamma)$
  - in diffractive (pomeron) production
  - interference effect
- More radiative couplings (heavier mesons?)
- Test of ChPT at low masses (chiral diagrams)



chiral contribution to 3π production in $\pi\gamma$ scattering

Challenges and Opportunities in the light (u,d) Quark Sector

- High density of states; broad, overlapping states
- Exploit interference effects $\longrightarrow$ phase motion
- Requires high statistics, complete PS coverage

$\longrightarrow$ **COMPASS can contribute significantly in the low mass region**

COMPASS 2004 Pilot Hadron Run

Experimental Setup

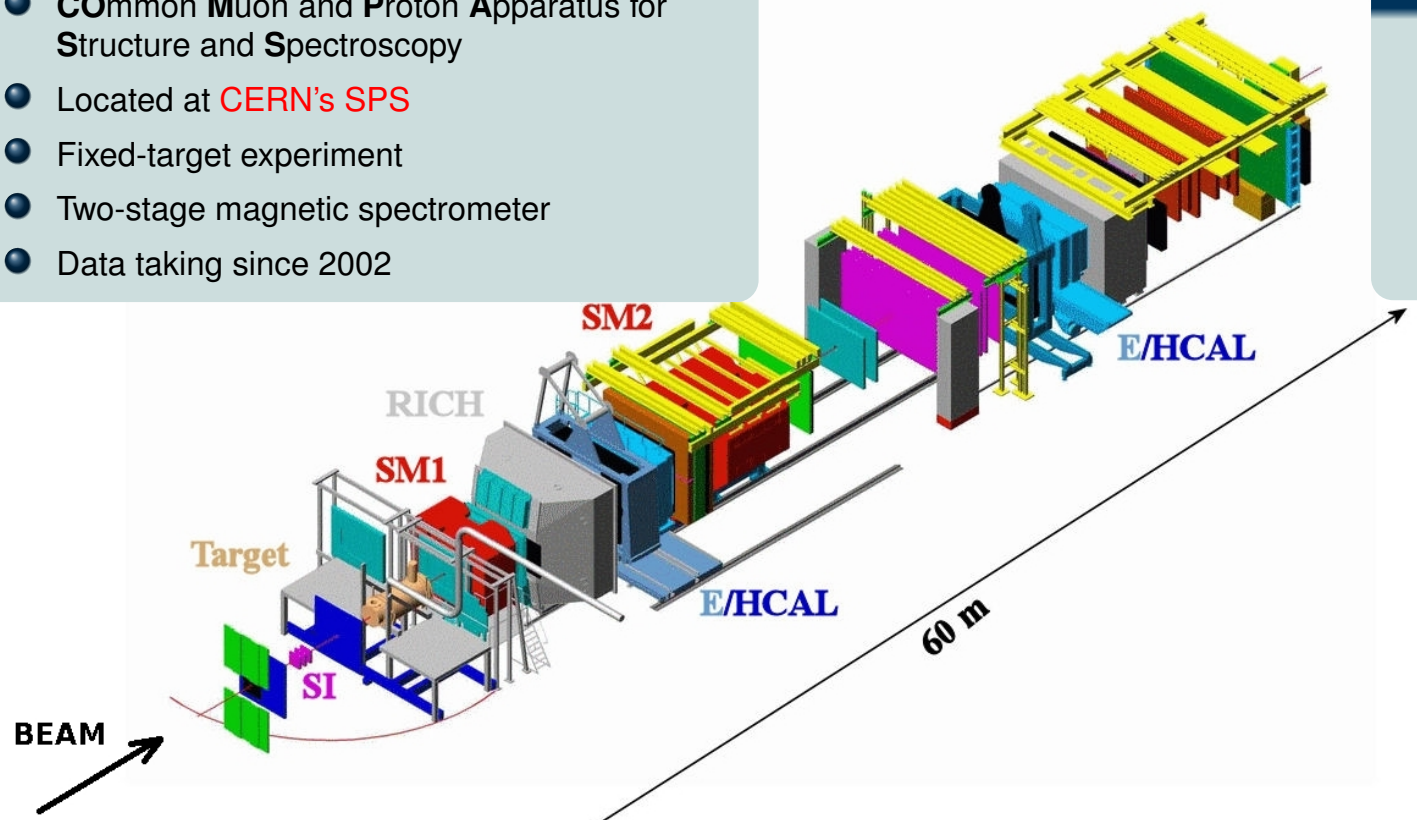
Technische Universität München

Overview

- **CO**mmon **M**uon and **P**roton **A**pparatus for **S**tructure and **S**pectroscopy
- Located at CERN's SPS
- Fixed-target experiment
- Two-stage magnetic spectrometer
- Data taking since 2002

Second./Tert. SPS Beams

- Muons: $4 \cdot 10^7 s^{-1}$
- Hadrons: up to $2 \cdot 10^7 s^{-1}$
- E: 100-250 GeV



Physics Goals

- Nucleon spin structure
- Hadron spectroscopy

COMPASS 2004 Pilot Hadron Run

Experimental Setup

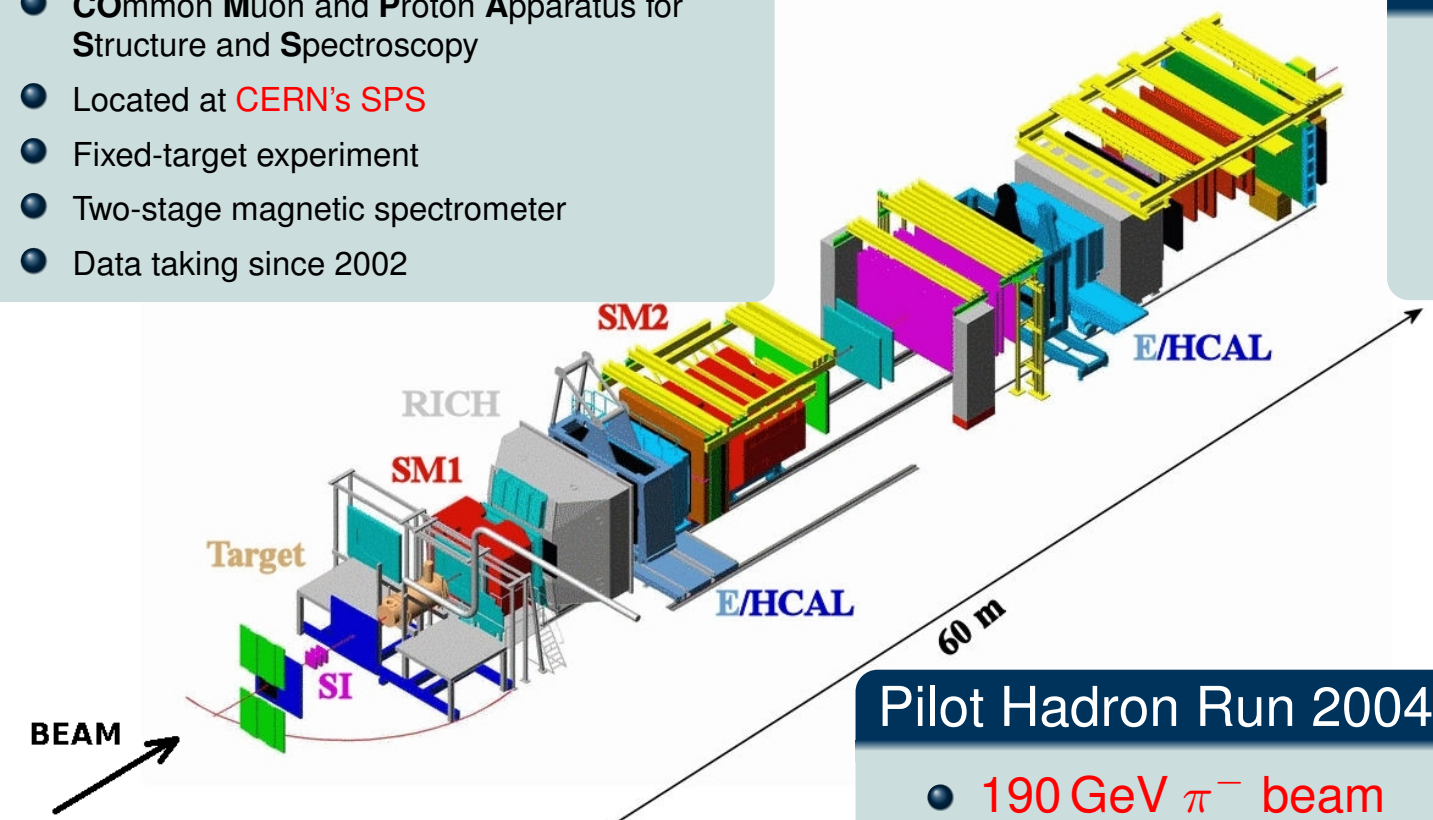
Technische Universität München

Overview

- **CO**mmon **M**uon and **P**roton **A**pparatus for **S**tructure and **S**pectroscopy
- Located at CERN's SPS
- Fixed-target experiment
- Two-stage magnetic spectrometer
- Data taking since 2002

Second./Tert. SPS Beams

- Muons: $4 \cdot 10^7 s^{-1}$
- Hadrons: up to $2 \cdot 10^7 s^{-1}$
- E: 100-250 GeV



Physics Goals

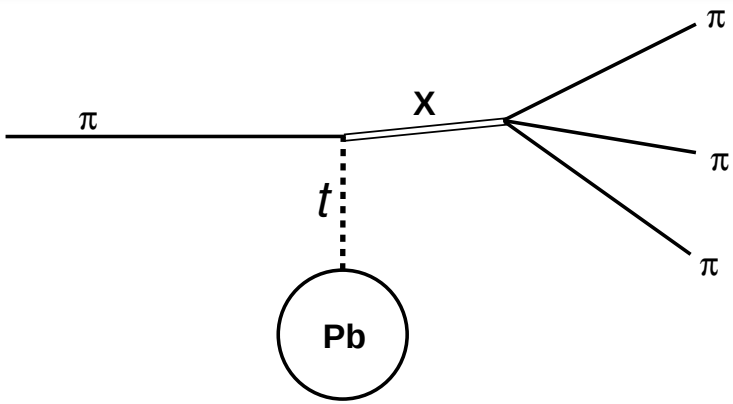
- Nucleon spin structure
- Hadron spectroscopy

Pilot Hadron Run 2004

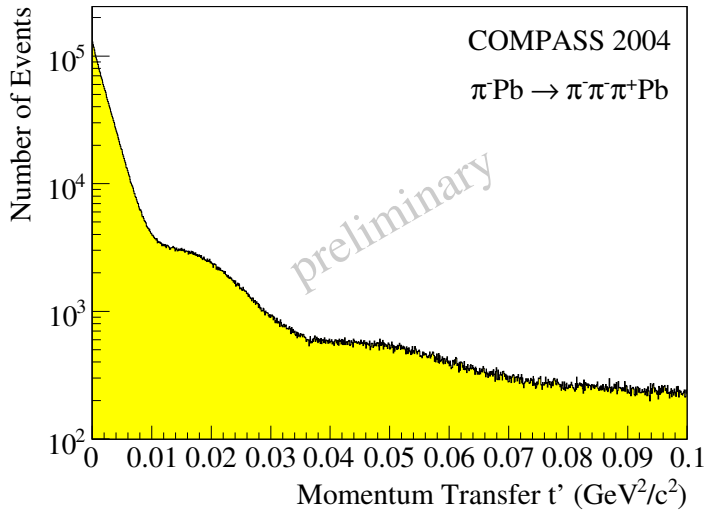
- 190 GeV π^- beam
- Nuclear targets (Pb)
- Tracking: Silicons for vertexing
- Trigger: Multiplicity trigger, ECAL trigger

Diffractive and Coulomb Production of Mesons

- Diffraction: target particle remains intact
  $\rightarrow$ low momentum transfer
  $I = 0$ Reggeon t-channel exchange
- Primakoff: photon exchange
  contribution at smallest momentum transfer

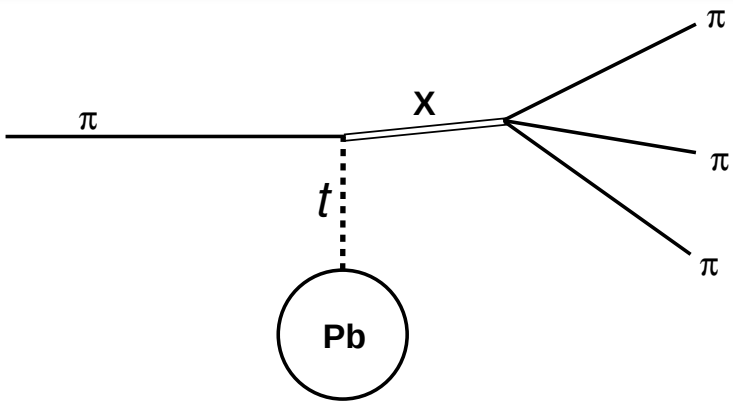


- Dissociation: beam pion is excited to a resonance X^-, which subsequently decays
  $\Rightarrow$ e. g. $\pi^- \mathrm{Pb} \rightarrow X^- \mathrm{Pb} \rightarrow \pi^-\pi^-\pi^+\mathrm{Pb}$



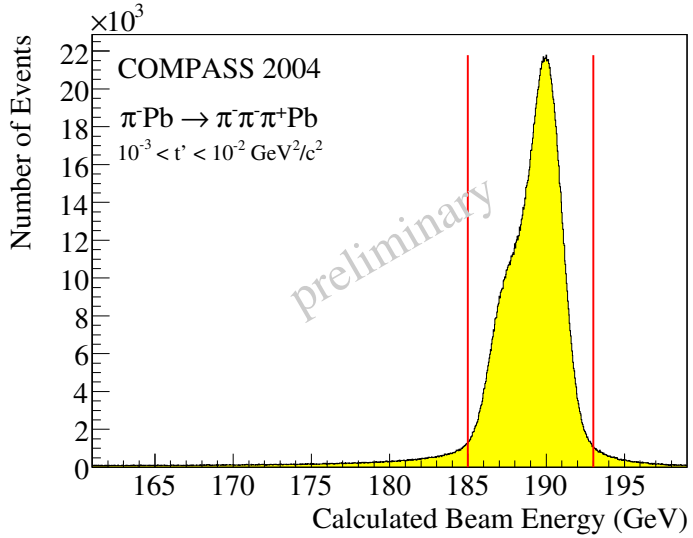
Diffractive and Coulomb Production of Mesons

- Diffraction: target particle remains intact
  → low momentum transfer
  $I = 0$ Reggeon t-channel exchange
- Primakoff: photon exchange
  contribution at smallest momentum transfer



- Dissociation: beam pion is excited to a resonance X^-, which subsequently decays
  ⇒ e. g. $\pi^- \mathrm{Pb} \to X^- \mathrm{Pb} \to \pi^-\pi^-\pi^+\mathrm{Pb}$

- Exclusive 3π final state events
- COMPASS 2004 (few days of data taking):
  - $\sim 4\,000\,000$ 3π events

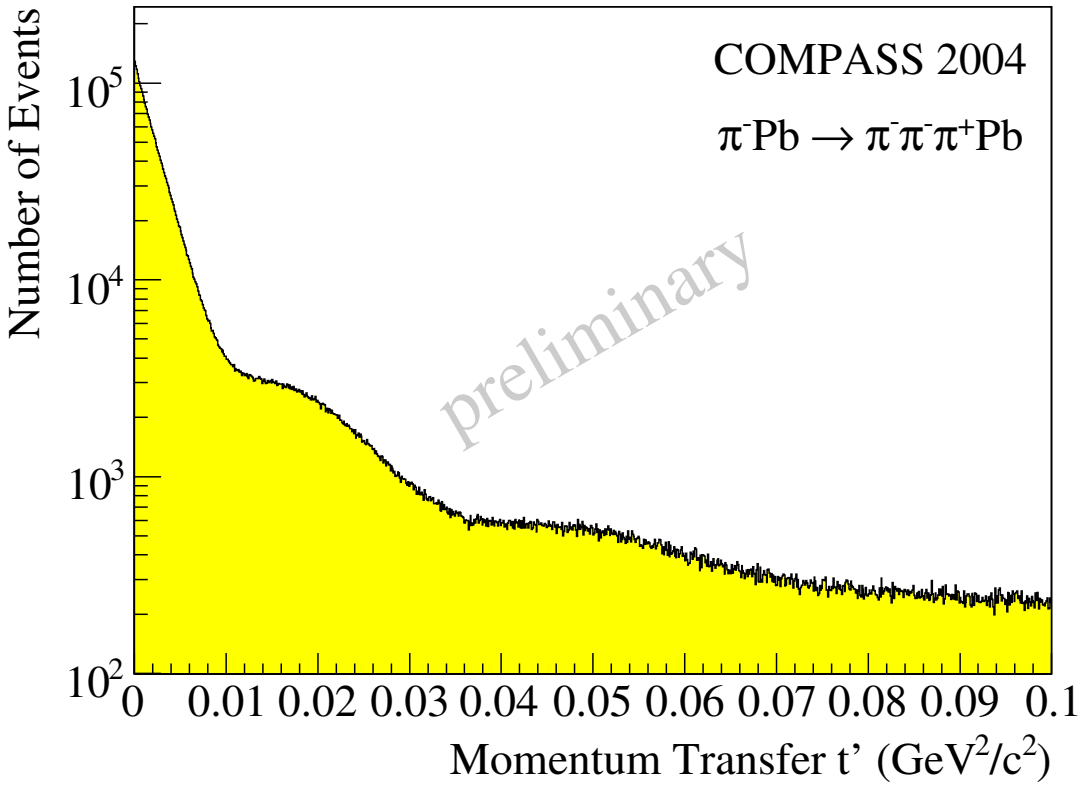


3π Data Sample (2004)

Momentum Transfer

Momentum transfer to target:

$$-t = -(p_{\text{beam}} - p_{(\pi^-\pi^-\pi^+)})^2 \quad \Rightarrow t' = |t| - |t|_{\text{min}}$$



with

$$|t|_{\text{min}} = \frac{(m_{3\pi}^2 - m_\pi^2)^2}{4|\vec{p}_{\text{beam}}|_{\text{lab}}^2}$$

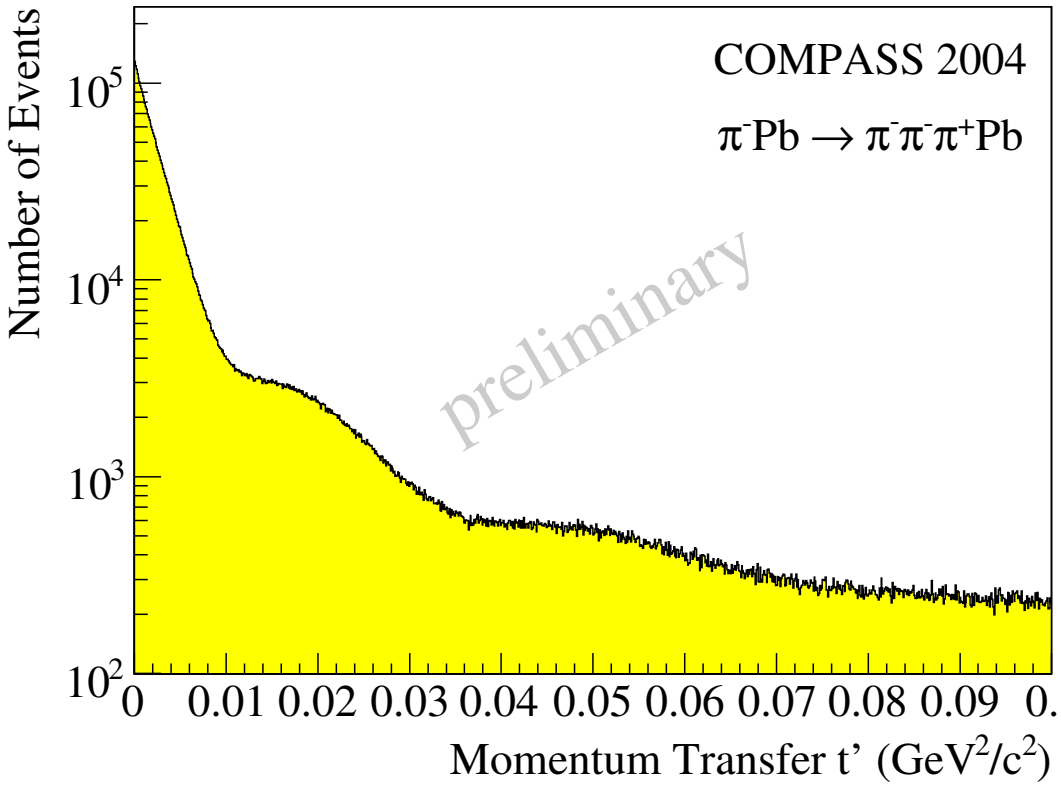
Diffraction pattern:
Pb nucleus acts like "black disc" in optics

3π Data Sample (2004)

Momentum Transfer

Momentum transfer to target:

$$-t = -(p_{\text{beam}} - p_{(\pi^-\pi^-\pi^+)})^2 \quad \Rightarrow t' = |t| - |t|_{\text{min}}$$



with

$$|t|_{\text{min}} = \frac{(m_{3\pi}^2 - m_\pi^2)^2}{4|\vec{p}_{\text{beam}}|_{\text{lab}}^2}$$

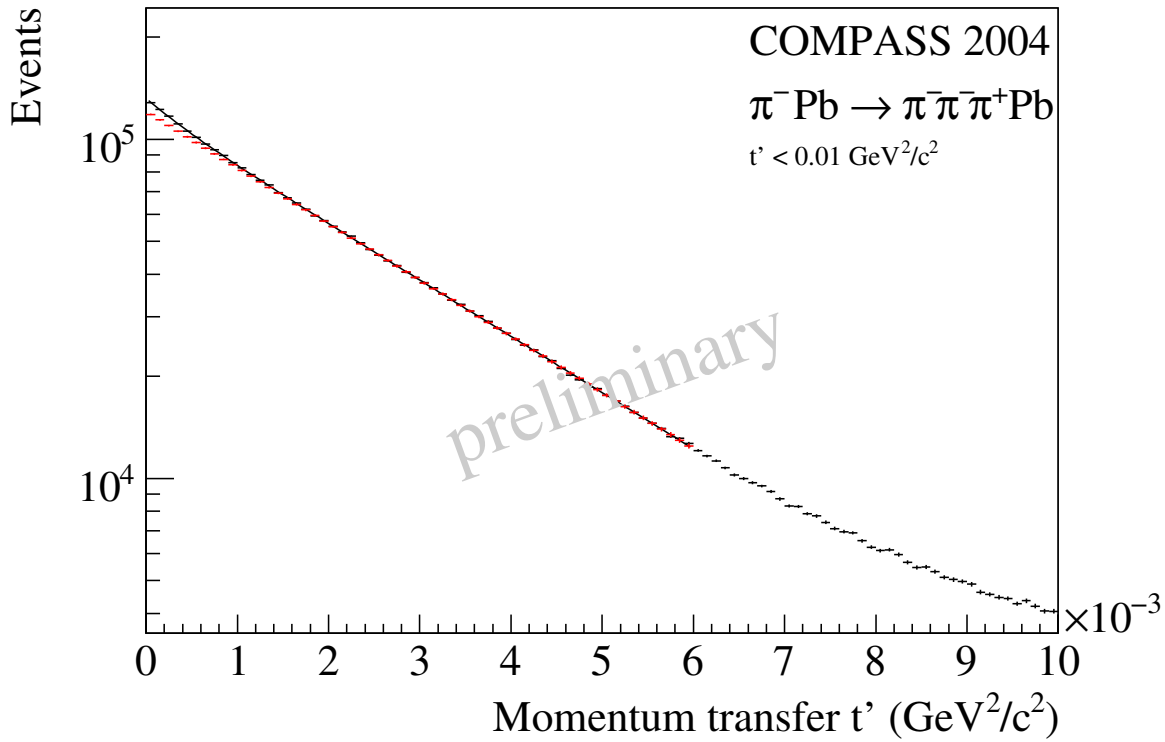
Diffraction pattern:
Pb nucleus acts like "black disc" in optics

- "Low t'": $10^{-3}\,(\text{GeV}/c)^2 < t' < 10^{-2}\,(\text{GeV}/c)^2$ $\sim 2\,000\,000$ events
- "Primakoff region": $t' < 10^{-3}\,(\text{GeV}/c)^2$ $\sim 1\,000\,000$ events

Primakoff contribution at $t' < 10^{-3}\,(\mathrm{GeV}/c)^2$

Primakoff: $\sigma(t') \propto \mathrm{e}^{-b_{\mathrm{Prim}}\,t'}$, $b_{\mathrm{Prim}} \approx 2000\,(\mathrm{GeV}/c)^{-2}$ (mainly resolution)

Diffractive: $\sigma(t') \propto \mathrm{e}^{-b_{\mathrm{diff}}\,t'}$, $b_{\mathrm{diff}} \approx 400\,(\mathrm{GeV}/c)^{-2}$ for lead target

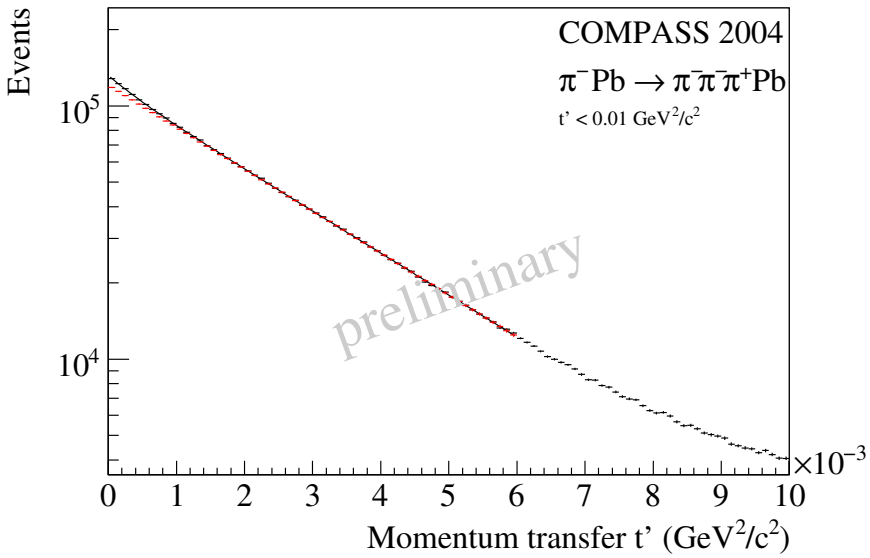


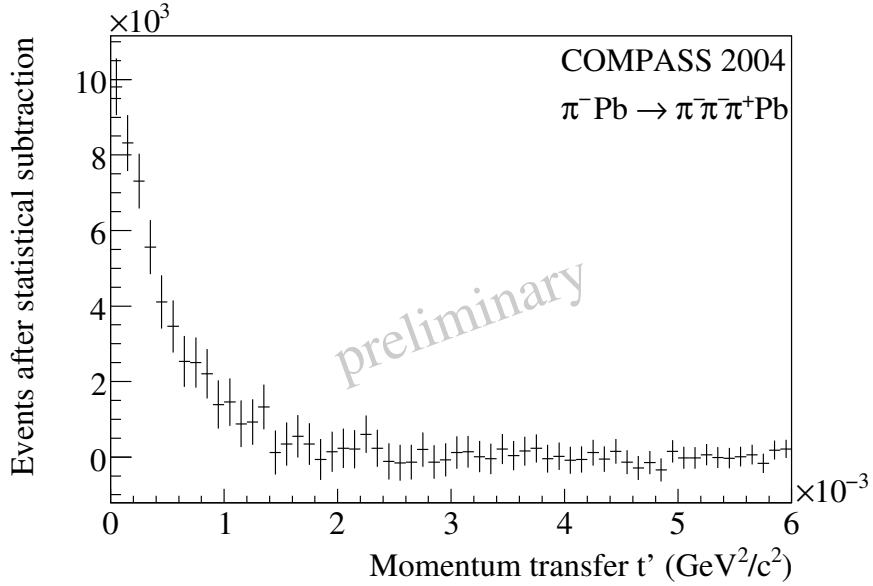
(Mass) spectrum of this Primakoff contribution?

$\Rightarrow$ Statistical subtraction of diffractive background (for bins of $m_{3\pi}$)

Basic features of the statistical subtraction

- Fit of t' spectrum with sum of both exponentials for $0 < t' < 0.006\,(\mathrm{GeV}/c)^2$ ($0.5 < m_{3\pi} < 2.5\,\mathrm{GeV}/c^2$)
- Subtraction of "diffractive" exponent from t' spectrum



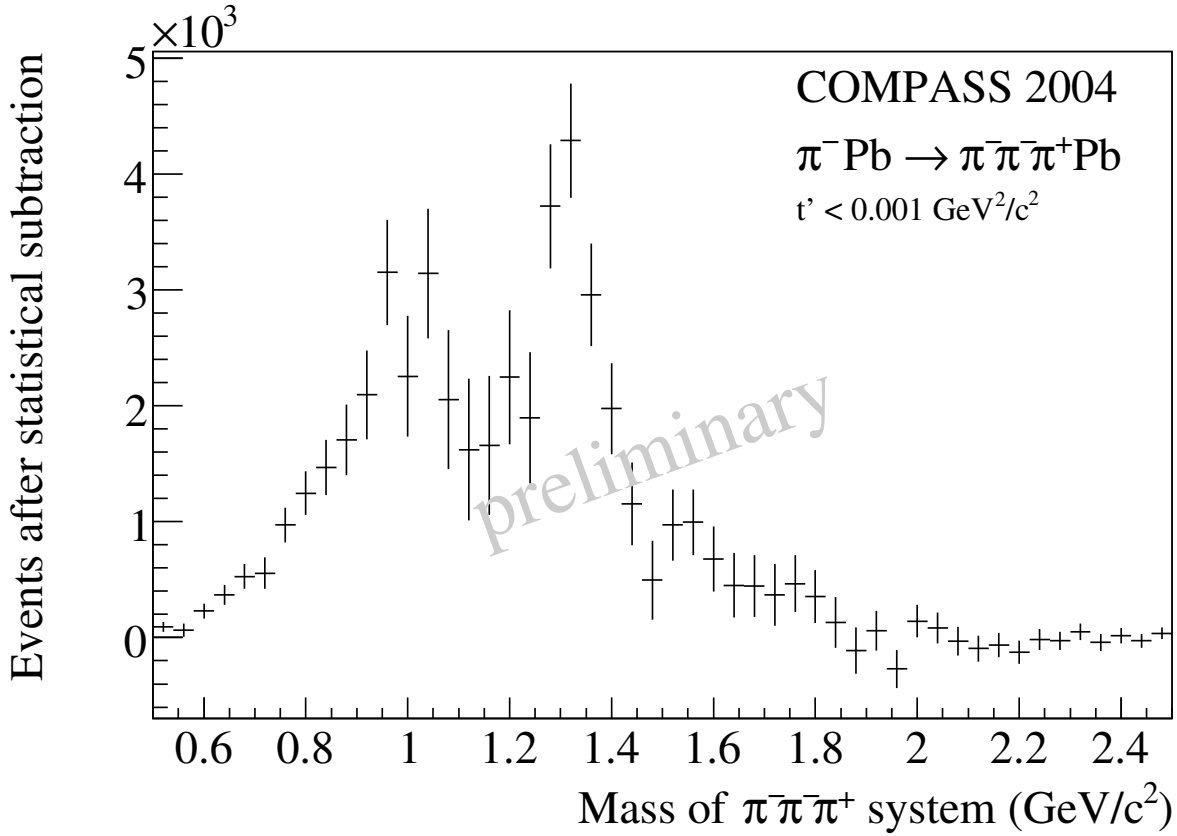


- Fit and subtraction in 3π mass bins:
  - $b_{\mathrm{Prim}} = 2050\,(\mathrm{GeV}/c)^{-2}$ fixed
  - b_{diff} as fit parameter

Primakoff contribution

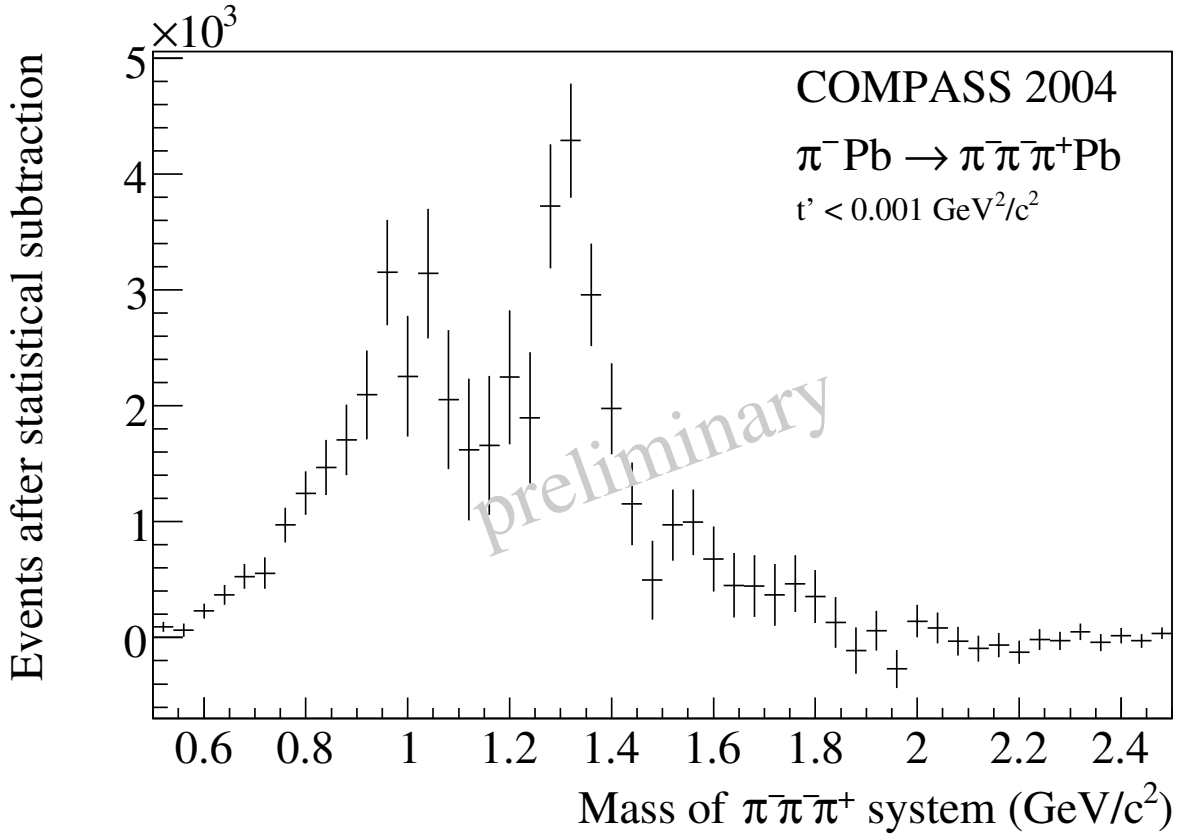
Mass spectrum from statistical subtraction

- Statistical subtraction separately in 40 MeV$/c^2$ mass bins
- Integrate Primakoff contribution of the t' spectra for $t' < 10^{-3}\,(\mathrm{GeV}/c)^2$



Mass spectrum from statistical subtraction

- Statistical subtraction separately in 40 MeV$/c^2$ mass bins
- Integrate Primakoff contribution of the t' spectra for $t' < 10^{-3}$ (GeV$/c$)^2



Selex, Phys. Lett. B 521(2001), 171-180

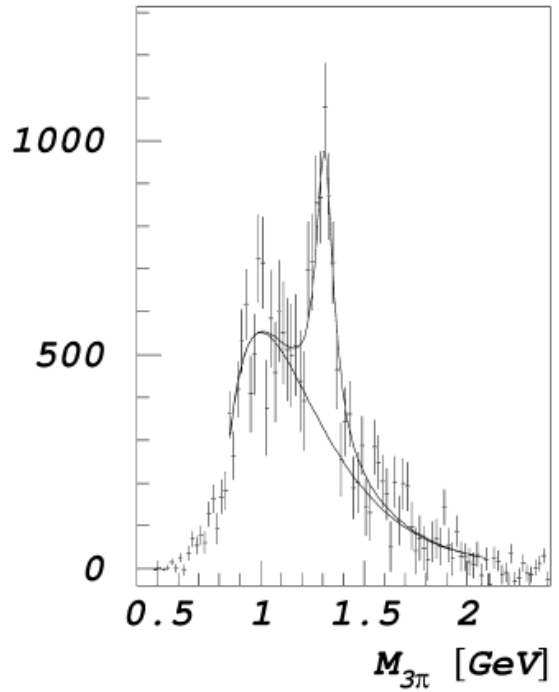


Fig. 3. $M_{3\pi}$ mass distribution for the Cu target after subtraction of diffractive background. The curve shows fit with a sum of pure Coulomb contribution and smooth background.

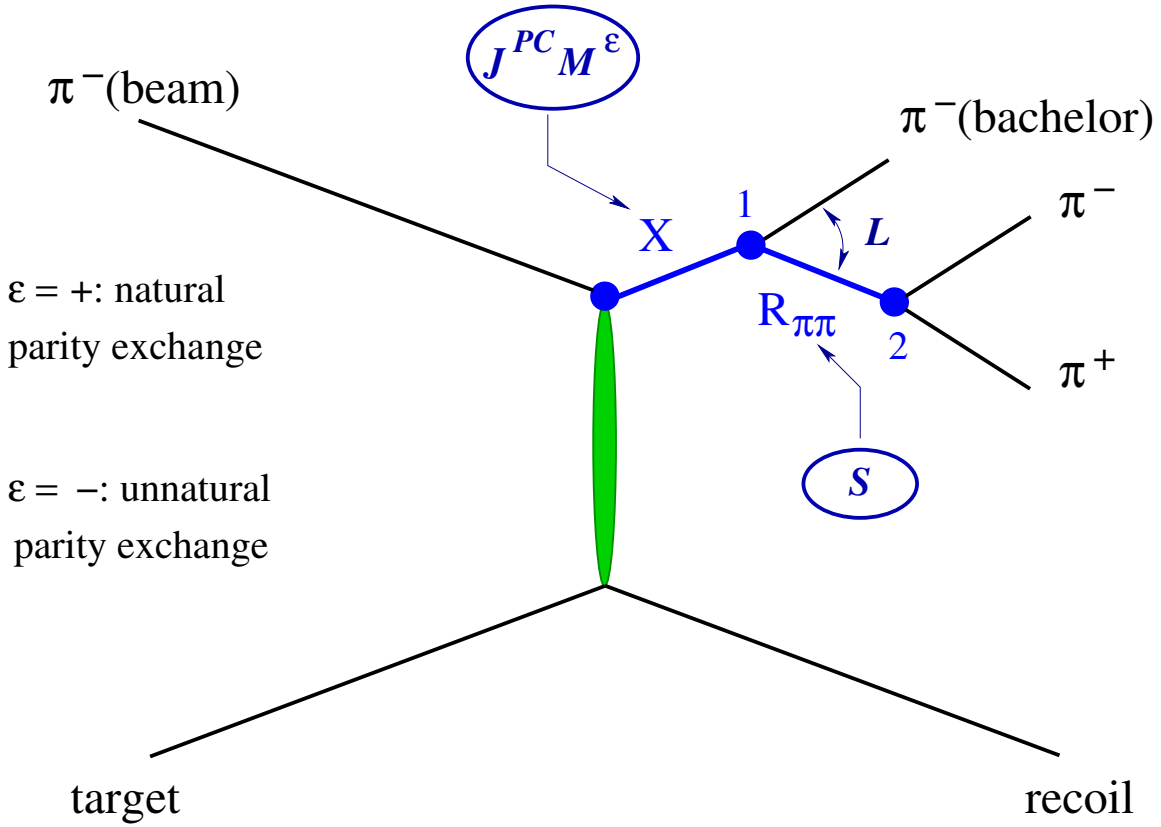
Partial Wave Analysis Formalism

Isobar Model

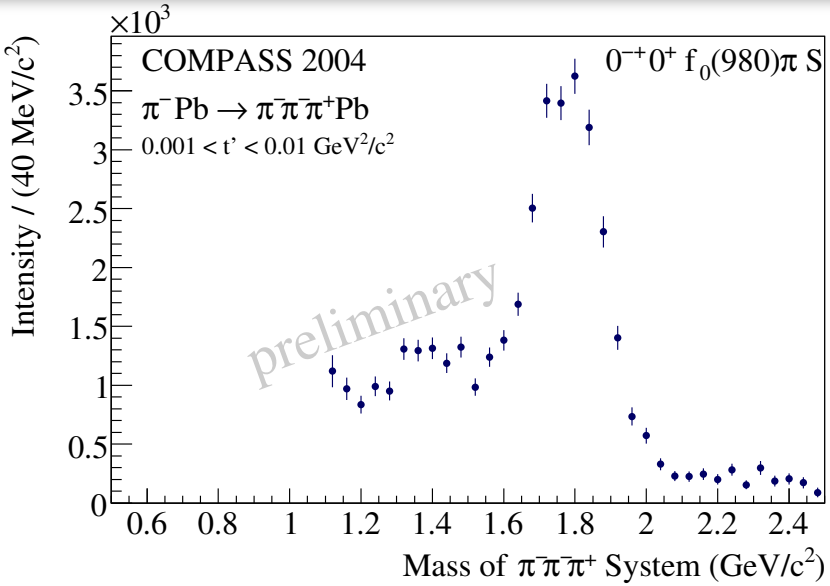


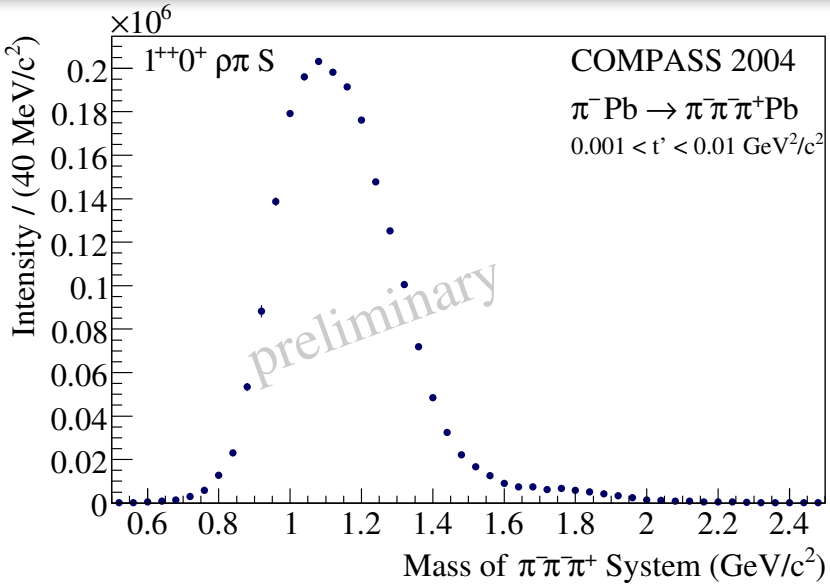
- Isobar model: Intermediate 2-particle decays
- Partial wave in reflectivity basis: $J^{PC}M^{\epsilon}[isobar]L$

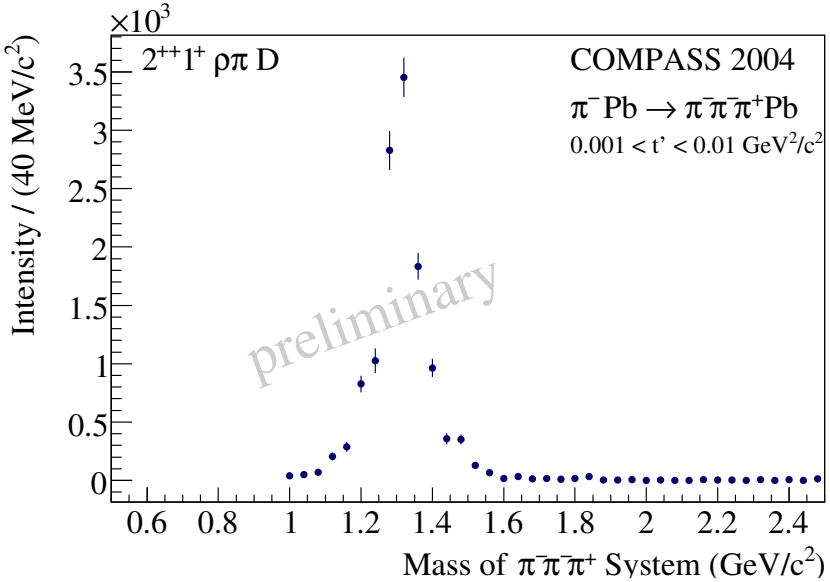
- Mass-independent PWA (40 MeV/c^2 mass bins): 38 waves
  Fit of angular dependence of partial waves, interferences
- Mass-dependent χ^2-fit

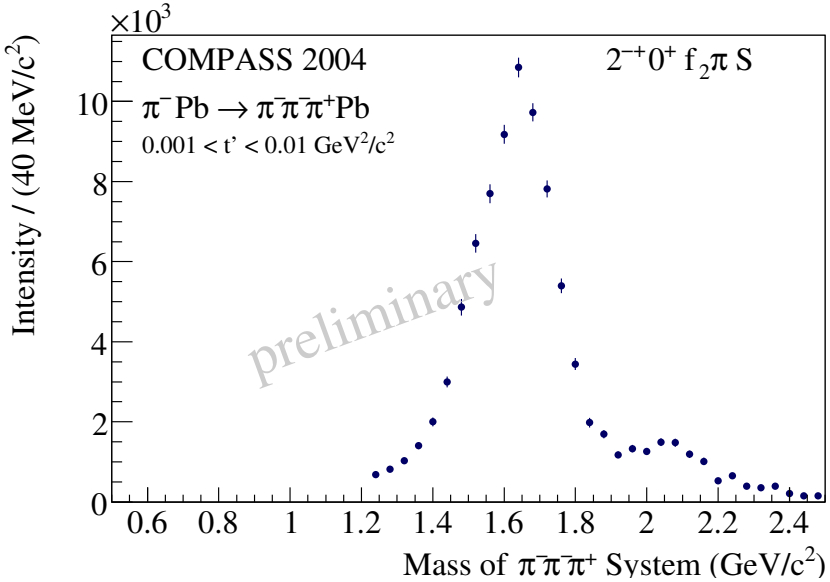
PWA of data with low t'

Intensity of selected waves: $0^{-+}0^{+}f_0(980)\pi S$, $1^{++}0^{+}\rho\pi S$, $2^{++}1^{+}\rho\pi D$, $2^{-+}0^{+}f_2(1270)\pi S$









Spin Totals for $t' < 10^{-3}\,(\mathrm{GeV}/c)^2$

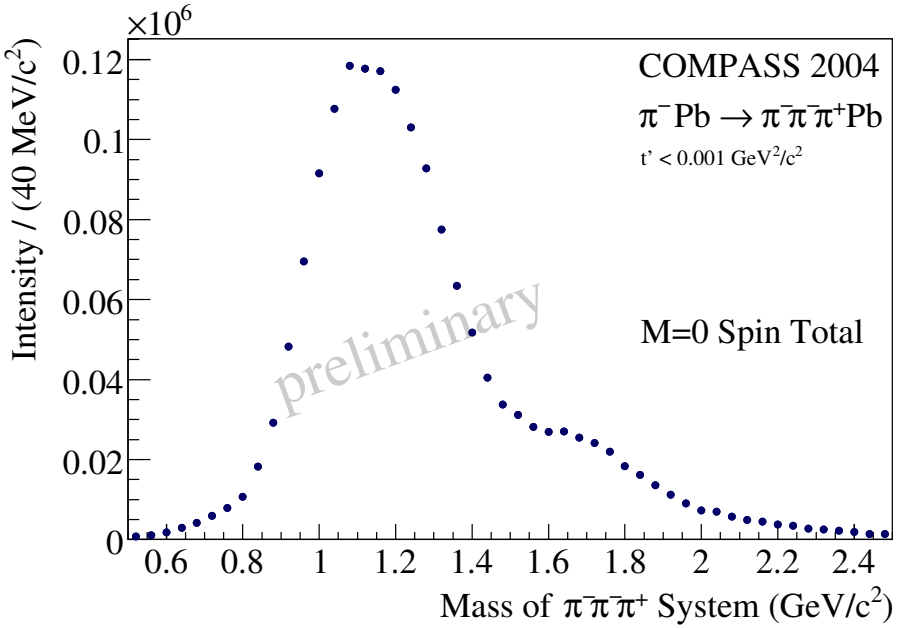
”Spin Totals”: Sum of all contributions for given M (i.e. z-projection of J)

t'-dependent amplitudes:

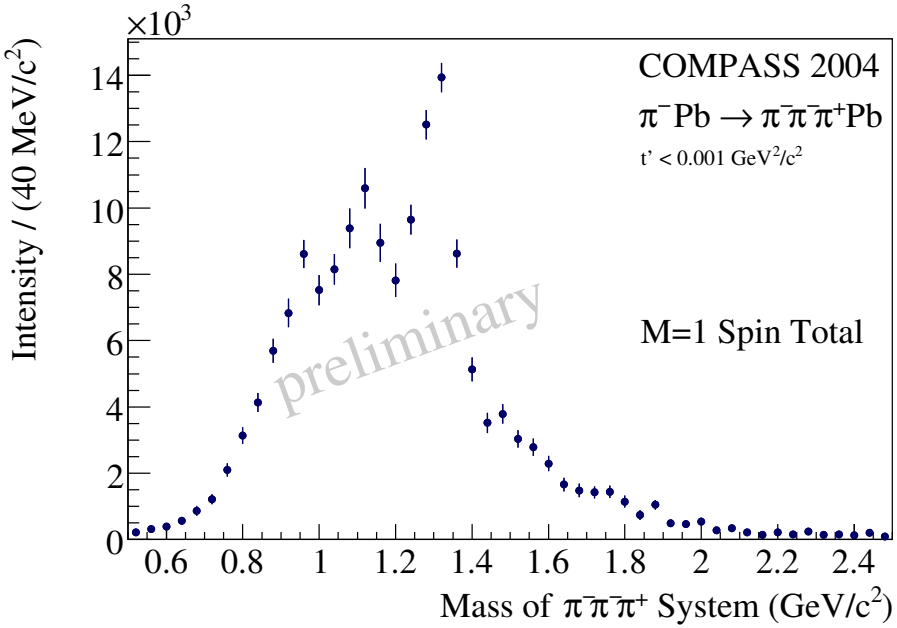
Primakoff production: M=1: $\sigma(t') \propto \mathrm{e}^{-b_{\mathrm{Prim}} t'} \longrightarrow$ arises at $t' \approx 0$ (resoluted shape!)

Diffractive production: M=0: $\sigma(t') \propto \mathrm{e}^{-b_{\mathrm{diff}}(m) t'}$

M=1: $\sigma(t') \propto t' \mathrm{e}^{-b_{\mathrm{diff}}(m) t'} \longrightarrow$ vanishes for $t' \approx 0$

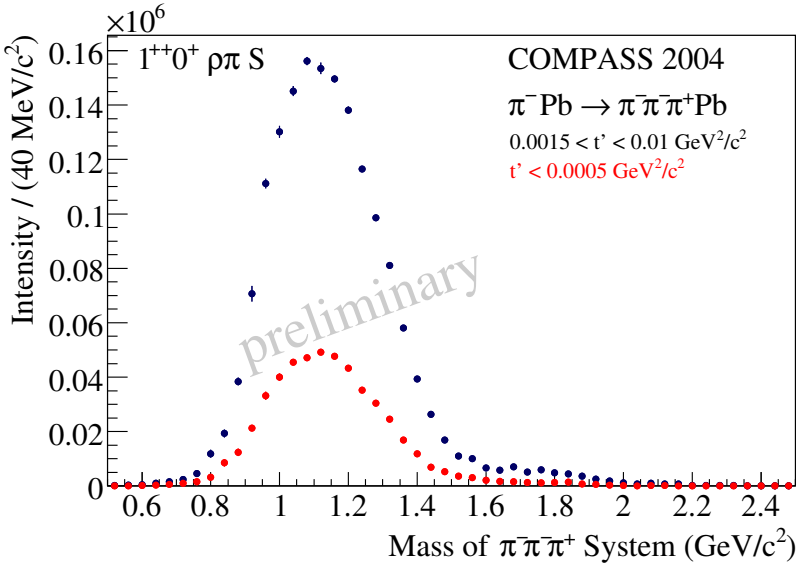


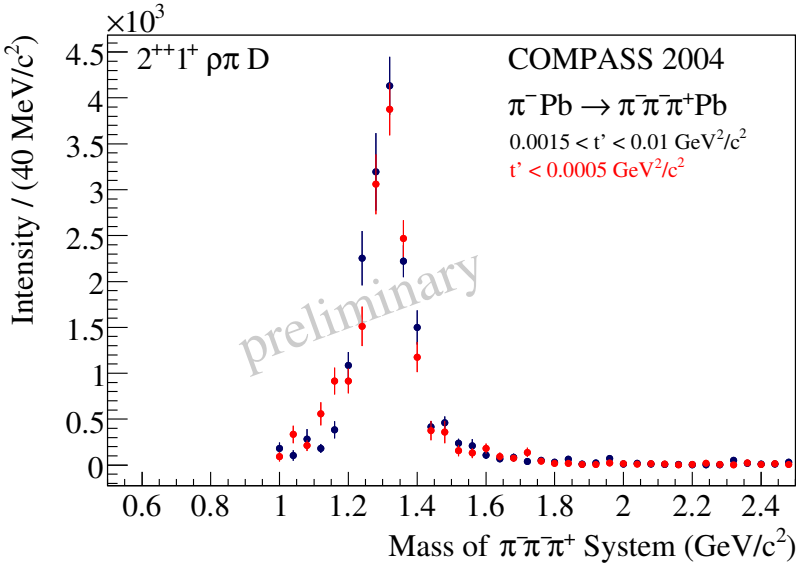
M=0

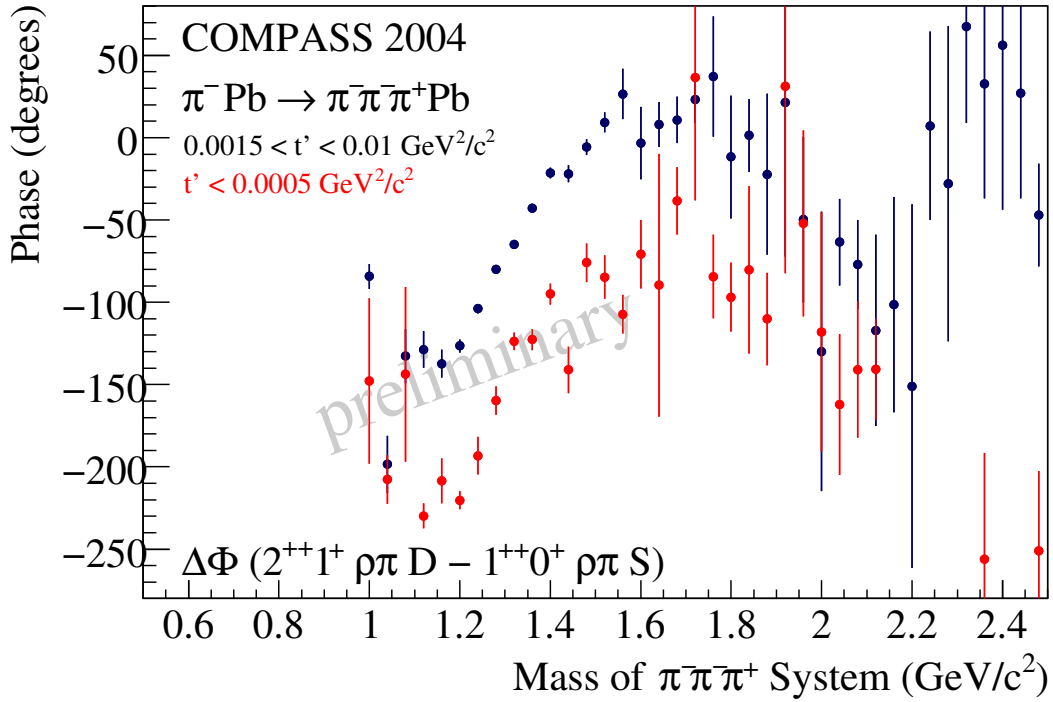


M=1

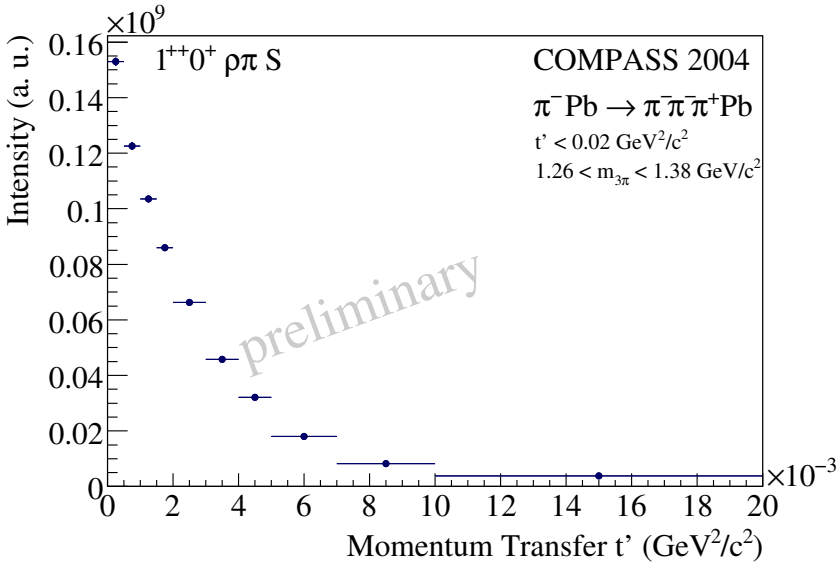
Production Phase $a_2 - a_1$ for separated t' regions

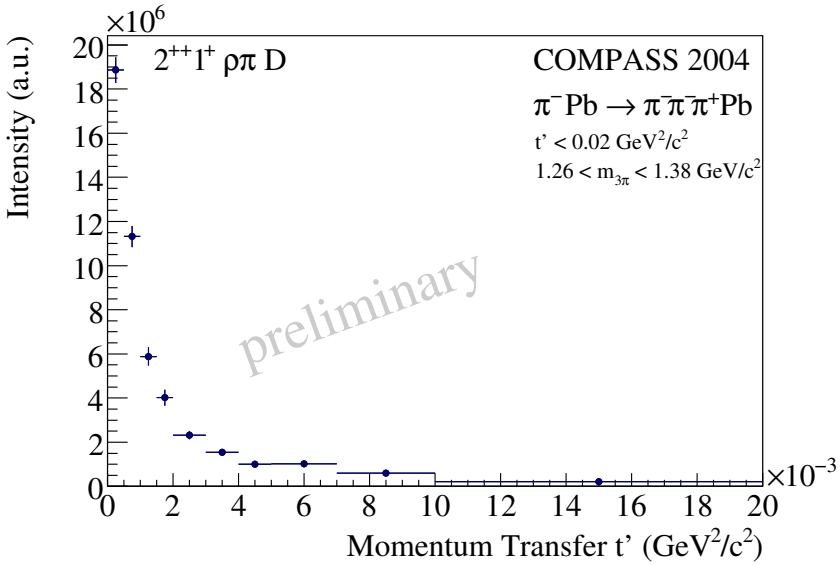


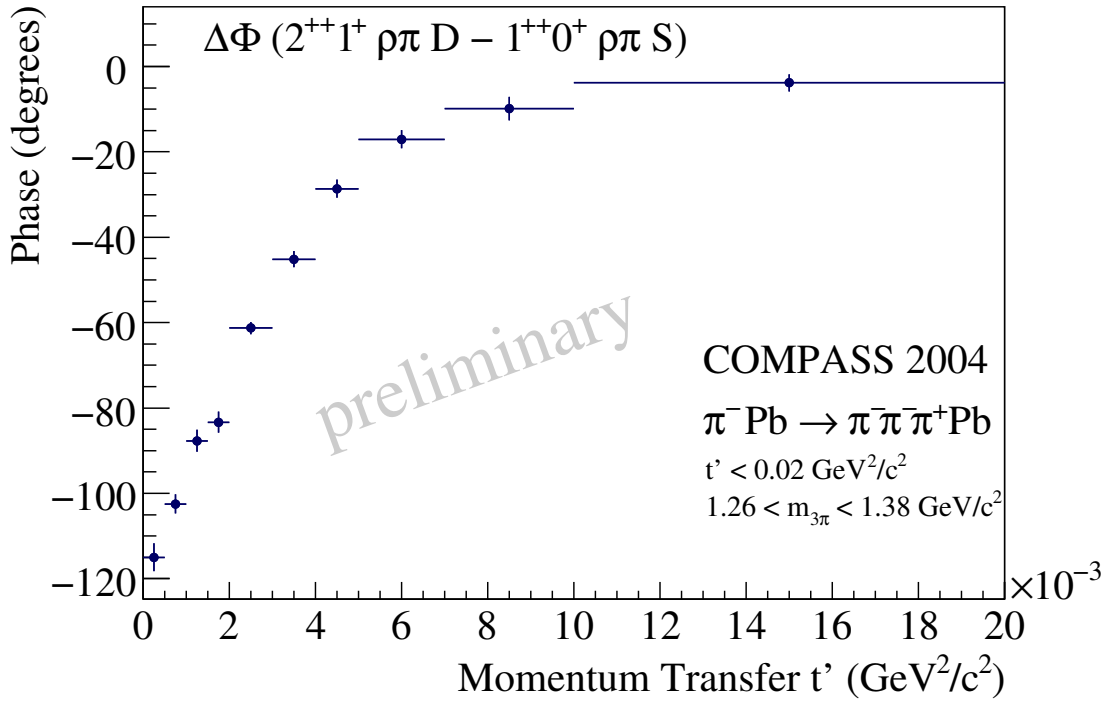




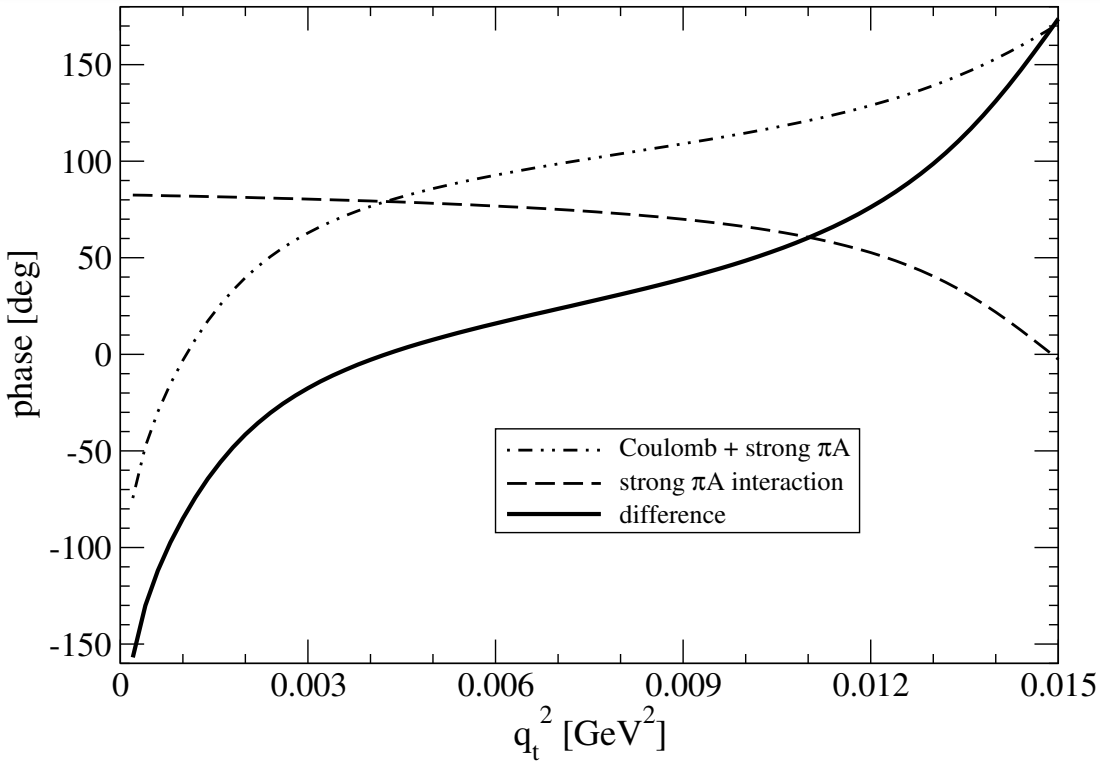
Phase $a_2 - a_1$ in detail: t' dependence

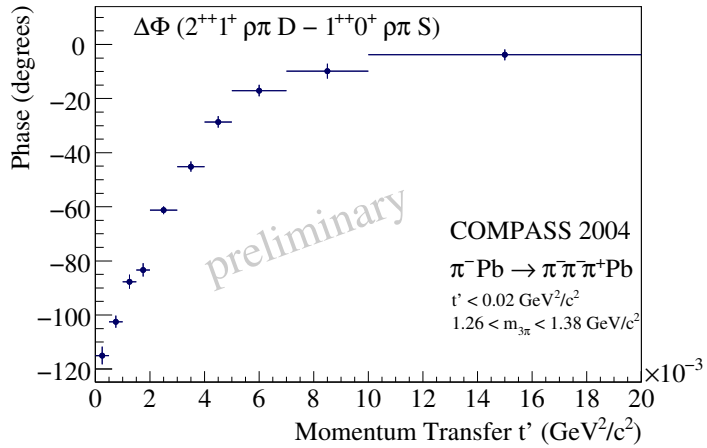






Theory: Phase a_2(strong+Coulomb)-a_1(strong)





Glauber modell

G. Fäldt and U. Tengblad, Phys. Rev. C79, 014607 (2009)

Plot: N. Kaiser (TU München)

⇒ indicates confirmation of interference Coulumb-interaction - strong interaction

⇒ detailed studies of the nature of resonances

Summary and Outlook

- COMPASS 2004 hadron run (few days) using a 190 GeV π^- beam
- $\pi^- Pb \rightarrow \pi^-\pi^-\pi^+ Pb$ at (very) low momentum transfer
- Extraction of photo-produced contribution
- PWA in mass bins and t' bins
- Production phase of $a_2(1320)$ dependent on t' shows interference of contributions from Coulomb and strong interaction

Further Analysis of 3π data at low momentum transfer:

- Mass-dependent PWA:
  Proper incorporation of Deck effect,
  Test of chiral diagrams in threshold mass region
- Comparison with hydrogen, lead and nickel data (2009, extended spectrometer)
