# Introduction to GPDs

“GPDs are **non-perturbative** objects entering the description of **hard exclusive** electroproduction”

Definition of variables:

- x: average long. momentum - NOT ACCESSIBLE
- $\xi$ : long. mom. difference  $\approx x_B/(2 - x_B)$
- t: four-momentum transfer  
related to  $b_{\perp}$  via Fourier transform

# Introduction to GPDs

“GPDs are **non-perturbative** objects entering the description of **hard exclusive** electroproduction”

They encode **CORRELATIONS** between the long. mom.  $\mathbf{x}$  and the transv. position  $\mathbf{b}_\perp$  of partons

Definition of variables:

- $x$ : average long. momentum - NOT ACCESSIBLE
- $\xi$ : long. mom. difference  $\approx x_B/(2 - x_B)$
- $t$ : four-momentum transfer related to  $\mathbf{b}_\perp$  via Fourier transform

# Introduction to GPDs

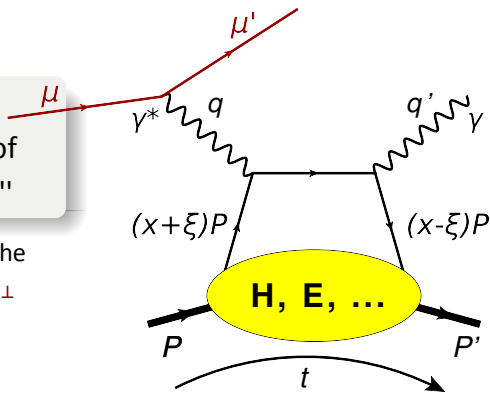

“GPDs are **non-perturbative** objects entering the description of **hard exclusive** electroproduction”

They encode **CORRELATIONS** between the long. mom.  $\mathbf{x}$  and the transv. position  $\mathbf{b}_\perp$  of partons

Experimentally accessible through Compton Form Factors (CFFs):

$$\text{Im}\mathcal{H}(\xi, t) = \mathbf{H}(\mathbf{x} = \xi, \xi, t)$$

$$\text{Re}\mathcal{H}(\xi, t) = \int \frac{d\mathbf{x} \mathbf{H}(\mathbf{x}, \mathbf{x}, t)}{(\mathbf{x} - \xi)} + \text{Dterm}$$

Definition of variables:

$x$ : average long. momentum - NOT ACCESSIBLE

$\xi$ : long. mom. difference  $\approx x_B/(2 - x_B)$

$t$ : four-momentum transfer related to  $\mathbf{b}_\perp$  via Fourier transform

**COMPASS:** Versatile facility to study QCD  
with hadron ( $\pi^\pm$ ,  $K^\pm$ ,  $p$  ...) and lepton (polarized  $\mu^\pm$ ) beams  
of  $\sim 200$  GeV for hadron spectroscopy and  
hadron structure studies using SIDIS, DY, DVCS, DVMP...

# The COMPASS set-up for the GPD program

Two stage magnetic spectrometer for **large angular & momentum acceptance**

Particle identification with:

- Ring Imaging Cerenkov Detector
- Electromagnetic calorimeters (**ECAL0, ECAL1 & ECAL2**)
- Hadronic calorimeters
- Muon absorbers

# The COMPASS set-up for the GPD program

# The COMPASS set-up for the GPD program

ECAL1

Key features of COMPASS:

- Muon beams with opposite **charge** and **polarization**
  - $E_{\mu} = 160 \text{ GeV}$
  - $\sim 4 \cdot 10^8 \mu/\text{spill}$ , 9.6s/40s duty cycle
- Reconstruction of the full event kinematics
- Recoil proton momentum from target TOF detector
- Photon energy and angle from ECALs

# The GPD Physics Program at COMPASS

**2008:** Very short test run, short LH<sub>2</sub> target

- Observation of exclusive photon production
- Confirmed the global efficiency  $\approx 10\%$  used for projections

**2009:** **10 days**, short LH<sub>2</sub> target

- Coarse binning in  $x_B$
- First hint of DVCS at large  $x_B$

**2004-10:** Exclusive  $\rho^0$  and  $\omega^0$  meson production on a **transv. pol. target** and **no recoil detector**

**2012:** **4 weeks**, full-scale LH<sub>2</sub> target and recoil detector

**2016-7:** **2 x 6 months** with LH<sub>2</sub> target and recoil det. → **GPD H**

**>2018:** DVCS with **transv. pol. target** and **recoil detector** → **GPD E**

Future addendum to COMPASS-II proposal

# The DVCS Process at COMPASS Kinematics

$$d\sigma \propto |T^{BH}|^2 + \text{Interference Term} + |T^{DVCS}|^2$$

$0.005 < x_B < 0.01$

**BH dominates**

excellent

reference yield

$0.01 < x_B < 0.03$

**study of Interference**

# Measurements of DVCS and BH Cross-sections

cross-sections on proton for  $\mu^{+\downarrow}$ ,  $\mu^{-\uparrow}$  beam with opposite charge & spin ( $e_\mu$  &  $P_\mu$ )

$$d\sigma_{(\mu p \rightarrow \mu p \gamma)} = d\sigma^{\text{BH}} + d\sigma^{\text{DVCS}}_{\text{unpol}} + P_\mu d\sigma^{\text{DVCS}}_{\text{pol}} \\ + e_\mu a^{\text{BH}} \Re A^{\text{DVCS}} + e_\mu P_\mu a^{\text{BH}} \text{Im} A^{\text{DVCS}}$$

Charge & Spin Difference and Sum:

$$D_{CS,U} \equiv d\sigma(\mu^{+\downarrow}) - d\sigma(\mu^{-\uparrow}) \propto c_0^{\text{Int}} + c_1^{\text{Int}} \cos \phi \quad \text{and} \quad c_{0,1}^{\text{Int}} \sim F_1 \Re \mathcal{H} \\ S_{CS,U} \equiv d\sigma(\mu^{+\downarrow}) + d\sigma(\mu^{-\uparrow}) \propto d\sigma^{\text{BH}} + c_0^{\text{DVCS}} + K s_1^{\text{Int}} \sin \phi \quad \text{and} \quad s_1^{\text{Int}} \sim F_1 \text{Im} \mathcal{H}$$

$$c_1^{\text{Int}} \propto \Re (F_1 \mathcal{H} + \xi (F_1 + F_2) \tilde{\mathcal{H}} - t/4m^2 F_2 \mathcal{E})$$

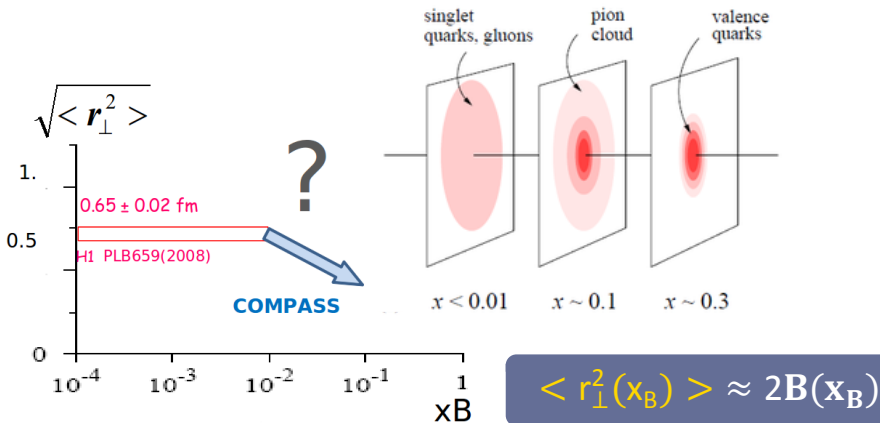

NOTE: ✓ dominance of  $\mathcal{H}$  with a proton target  
at COMPASS kinematics  
✓ only leading twist and LO

# Transverse Nucleon Imaging at COMPASS

Beam Charge and Spin **SUM**:

$$S_{CS,U} \equiv d\sigma(\mu^{+\leftarrow}) + d\sigma(\mu^{-\rightarrow}) \propto d\sigma^{BH} + d\sigma_{unpol}^{DVCS} + Ks_1^{Int} \sin \phi$$

Integration over  $\phi$  and BH subtraction  $\rightarrow d\sigma^{DVCS}/dt \sim \exp(-B|t|)$

# Transverse Nucleon Imaging at COMPASS

Beam Charge and Spin **SUM**:

$$S_{CS,U} \equiv d\sigma(\mu^{+\leftarrow}) + d\sigma(\mu^{-\rightarrow}) \propto d\sigma^{\text{BH}} + d\sigma_{\text{unpol}}^{\text{DVCS}} + K S_1^{\text{Int}} \sin \phi$$

Integration over  $\phi$  and BH subtraction  $\rightarrow d\sigma^{\text{DVCS}}/dt \sim \exp(-B|t|)$

**2 x 6 months of data**  
in 2016-2017

2.5 m LH<sub>2</sub> target

$\epsilon_{\text{global}} = 10\%$

Ansatz at small  $x_B$ :  
 $B(x_B) \approx B_0 + 2\alpha' \ln(x_0/x_B)$

expected statistical and systematic uncertainties are shown

# Transverse Nucleon Imaging at COMPASS

Beam Charge and Spin **SUM**:

$$S_{CS,U} \equiv d\sigma(\mu^{+\leftarrow}) + d\sigma(\mu^{-\rightarrow}) \propto d\sigma^{BH} + d\sigma_{unpol}^{DVCS} + Ks_1^{Int} \sin \phi$$

Integration over  $\phi$  and BH subtraction  $\rightarrow d\sigma^{DVCS}/dt \sim \exp(-B|t|)$

**4 weeks in 2012**

**2.5 m LH<sub>2</sub> target**

**2012: we can expect one mean value of B  
in the COMPASS kinematic range**

**2012 Pilot Run - 4 weeks**

## Time resolution measurement with cosmics

**Bad scintillator quality!**

Replacement in 2015

# Exclusive Photon Events Selection

Reconstructed interaction vertex in **target volume**

**One single photon** above DVCS production threshold

$$Q^2 > 1 \text{ (GeV/c)}^2, \quad 0.05 < y < 0.9, \quad 0.06 \text{ (GeV/c)}^2 < t < 0.64 \text{ (GeV/c)}^2$$

Exclusivity conditions:

- $\Delta\varphi = \varphi_{\text{meas}}^{\text{proton}} - \varphi_{\text{reco}}^{\text{proton}}$

- Vertex pointing ( $\Delta Z$ )

- Transv. momentum balance:

$$\Delta p_{\perp} = p_{\perp, \text{meas}}^{\text{proton}} - p_{\perp, \text{reco}}^{\text{proton}}$$

- Four-momentum balance:

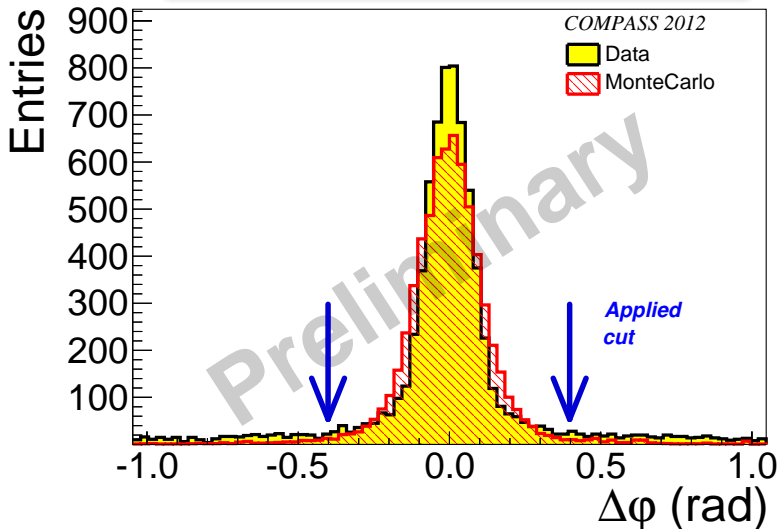

$$M_X^2 = (p_{\mu_{\text{in}}} + p_{p_{\text{in}}} - p_{\mu_{\text{out}}} - p_{p_{\text{out}}} - p_{\gamma})^2$$

- Missing energy:  $((p_{\mu_{\text{in}}} + p_{p_{\text{in}}} - p_{\mu_{\text{out}}} - p_{\gamma})^2 - M_p^2) / 2M_p$

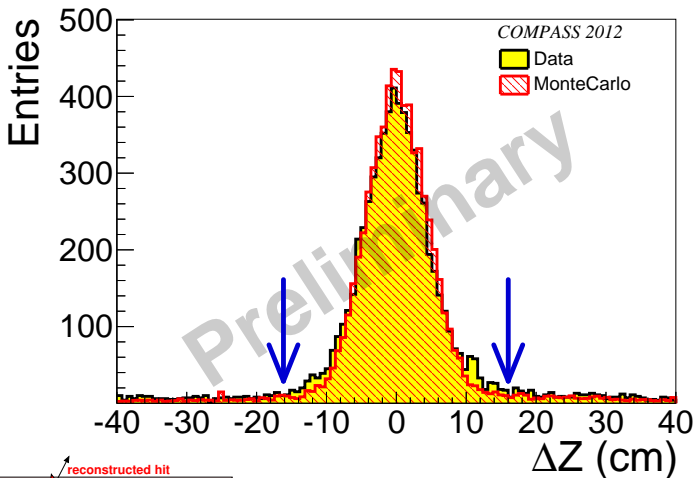

## Exclusivity Variables: $\Delta\varphi$

$$\Delta\varphi = \varphi_{\text{meas}}^{\text{proton}} - \varphi_{\text{reco}}^{\text{proton}}$$

# Exclusivity Variables: $\Delta Z$

## Exclusivity Variables: $\Delta p_{\perp}$

$$\Delta p_{\perp} = p_{\perp, \text{meas}}^{\text{proton}} - p_{\perp, \text{reco}}^{\text{proton}}$$

## Exclusivity Variables: $M_X^2$

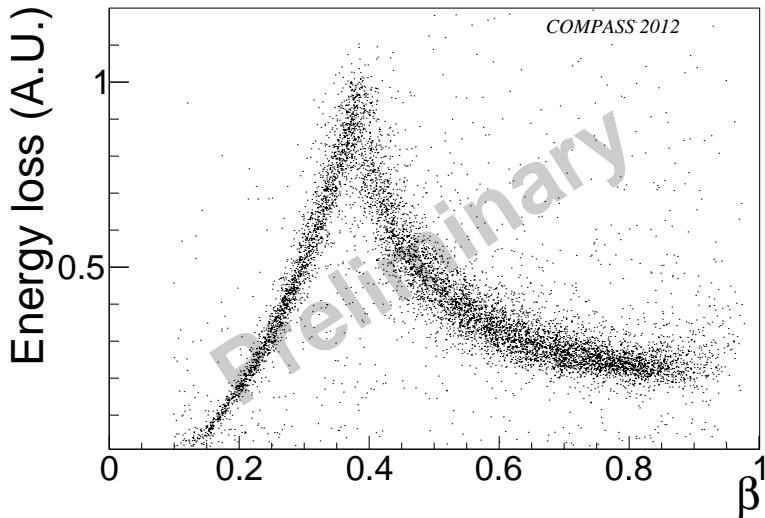

$$M_X^2 = (p_{\mu_{in}} + p_{p_{in}} - p_{\mu_{out}} - p_{p_{out}} - p_{\gamma})^2$$

## Proton Signal in Recoil Detector

**Signal amplitude** in outer scintillators vs. **beta** of recoiling particle

**Proton signature** clearly visible after all exclusivity conditions

## $\pi^0$ Background Estimation

$\pi^0$ s are one of the main background sources for exclusive photon events

Two possible cases:

- **visible** (both  $\gamma$  detected, easy to reject)
- **invisible** (one  $\gamma$  "lost", only estimated with MC)

## $\pi^0$ Background Estimation

$\pi^0$ s are one of the main background sources for exclusive photon events

Two possible cases:

- **visible** (both  $\gamma$  detected, easy to reject)
- **invisible** (one  $\gamma$  "lost", only estimated with MC)

"Visible" part estimated by combining the **exclusive  $\gamma$  candidates** with all additional **low-energy  $\gamma$ s** in the event

# $\pi^0$ Background Estimation

$\pi^0$ s are one of the main background sources for exclusive photon events

Two possible cases:

- **visible** (both  $\gamma$  detected, easy to reject)
- **invisible** (one  $\gamma$  "lost", only estimated with MC)

"Visible" part estimated by combining the **exclusive  $\gamma$  candidates** with all additional **low-energy  $\gamma$ s** in the event

"Invisible" part estimate via **MC simulations**:

- **Semi-inclusive** contribution from LEPTO
- **Exclusive** contribution from HEPGEN/ $\pi^0$  (Goloskokov-Kroll model)
- MC samples normalized to the "visible"  $\pi^0$  in real data
- Two extreme cases considered:
  1. Fully **semi-inclusive** background
  2. Fully **exclusive** background→ Gives **lower** and **upper** limits

# $\pi^0$ Background Estimation

$\pi^0$ s are one of the main background sources for exclusive photon events

Two possible cases:

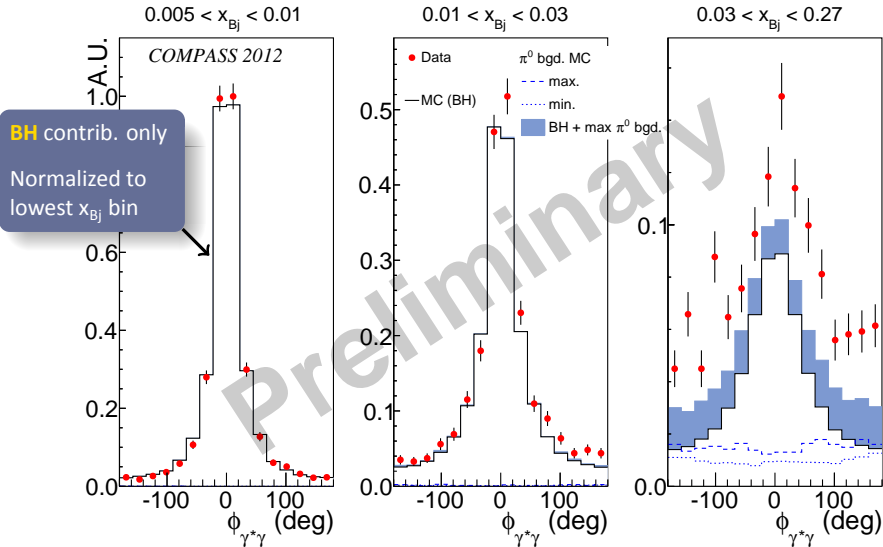

- **visible** (both  $\gamma$  detected, easy to reject)
- **invisible** (one  $\gamma$  "lost", only estimated with MC)

$M_{\gamma_{\text{excl}}\gamma_{\text{bgd}}}$  distribution  
(``Visible"  $\pi^0$ )

LEPTO and HEPGEN/ $\pi^0$  MC  
normalized to  $M_{\gamma_{\text{excl}}\gamma_{\text{bgd}}}$  peak  
from real data

# Exclusive $\gamma$ Azimuthal Distribution in 3 $x_{Bj}$ Bins

# Exclusive $\gamma$ Azimuthal Distribution in 3 $x_{Bj}$ Bins

0.005 <  $x_{Bj}$  < 0.01

0.01 <  $x_{Bj}$  < 0.03

0.03 <  $x_{Bj}$  < 0.27

Dominant **Bethe-Heitler** process clearly visible at small  $x_{Bj}$

$\phi_{\gamma^*\gamma}$  peak shape well reproduced by MC simulations

First estimation of  $\pi^0$  **background** at large  $x_{Bj}$

Data at large  $x_{Bj}$  show an **excess** compared to BH+background

# Exclusive $\gamma$ Azimuthal Distribution in 3 $x_{Bj}$ Bins

$0.005 < x_{Bj} < 0.01$

$0.01 < x_{Bj} < 0.03$

$0.03 < x_{Bj} < 0.27$

Dominant **Bethe-Heitler** process clearly visible at small  $x_{Bj}$

$\phi_{\gamma^*\gamma}$  peak shape well reproduced by MC simulations

First estimation of  $\pi^0$  **background** at large  $x_{Bj}$

Data at large  $x_{Bj}$  show an **excess** compared to BH+background

Next steps:

- **cross-section** extraction and **beam charge difference**
- **t-slope** extraction and nucleon tomography

# Backup Slides

# Recoil particle Measurement in CAMERA

$$E_{\text{loss}} \sim \sqrt{\text{Ampl}_{\text{up}} * \text{Ampl}_{\text{down}}}$$

$$\text{TOF} \rightarrow (t_{\text{up}} + t_{\text{down}})_{A,B}$$

$$z \rightarrow t_{\text{up}} - t_{\text{down}}$$

Count rates: > 5 MHz in ring A  
 ~1 MHz in ring B

# What Makes COMPASS Unique?

COMPASS covers the unexplored region between collider (H1+Zeus) and low-energy fixed target (Hermes+JLab) experiments

- $\mu^+$  and  $\mu^-$  beams
- momentum: 100 – 190 GeV/c
- beam polarization: 80 %  
opposite for  $\mu^+$  and  $\mu^-$
- coverage of intermediate  $x_B$ 
  - low  $x_B$ : **pure BH**  
useful for normalization
  - high  $x_B$ : **DVCS predominance**
- ↪ **unexplored region between ZEUS+H1 and HERMES+JLab**

# DVCS: What Can We Learn?

Phase 1: Polarized beam, unpol. target

DVCS dominance at large  $x_B$

BH/DVCS interf. at intermediate  $x_B$

$x_B$ -dependent transv. size of nucleon

$r_{\perp}$  parameter from slope of  $d\sigma^{\text{DVCS}}/dt$

Interference between BH and DVCS

"Boost" of DVCS through int. term

Measurement of  $\text{Re}\mathcal{H}(\xi, t)$  and  $\text{Im}\mathcal{H}(\xi, t)$  via  $\phi$ -modulation of cross section

- $\text{Re}\mathcal{H}(\xi, t) = P \int dx H(x, \xi, t)/(x - \xi)$
- $\text{Im}\mathcal{H}(\xi, t) = H(x = \xi, \xi, t)$

Exp. constrain to **GPD H**
