Grundlagenforschung

Outline

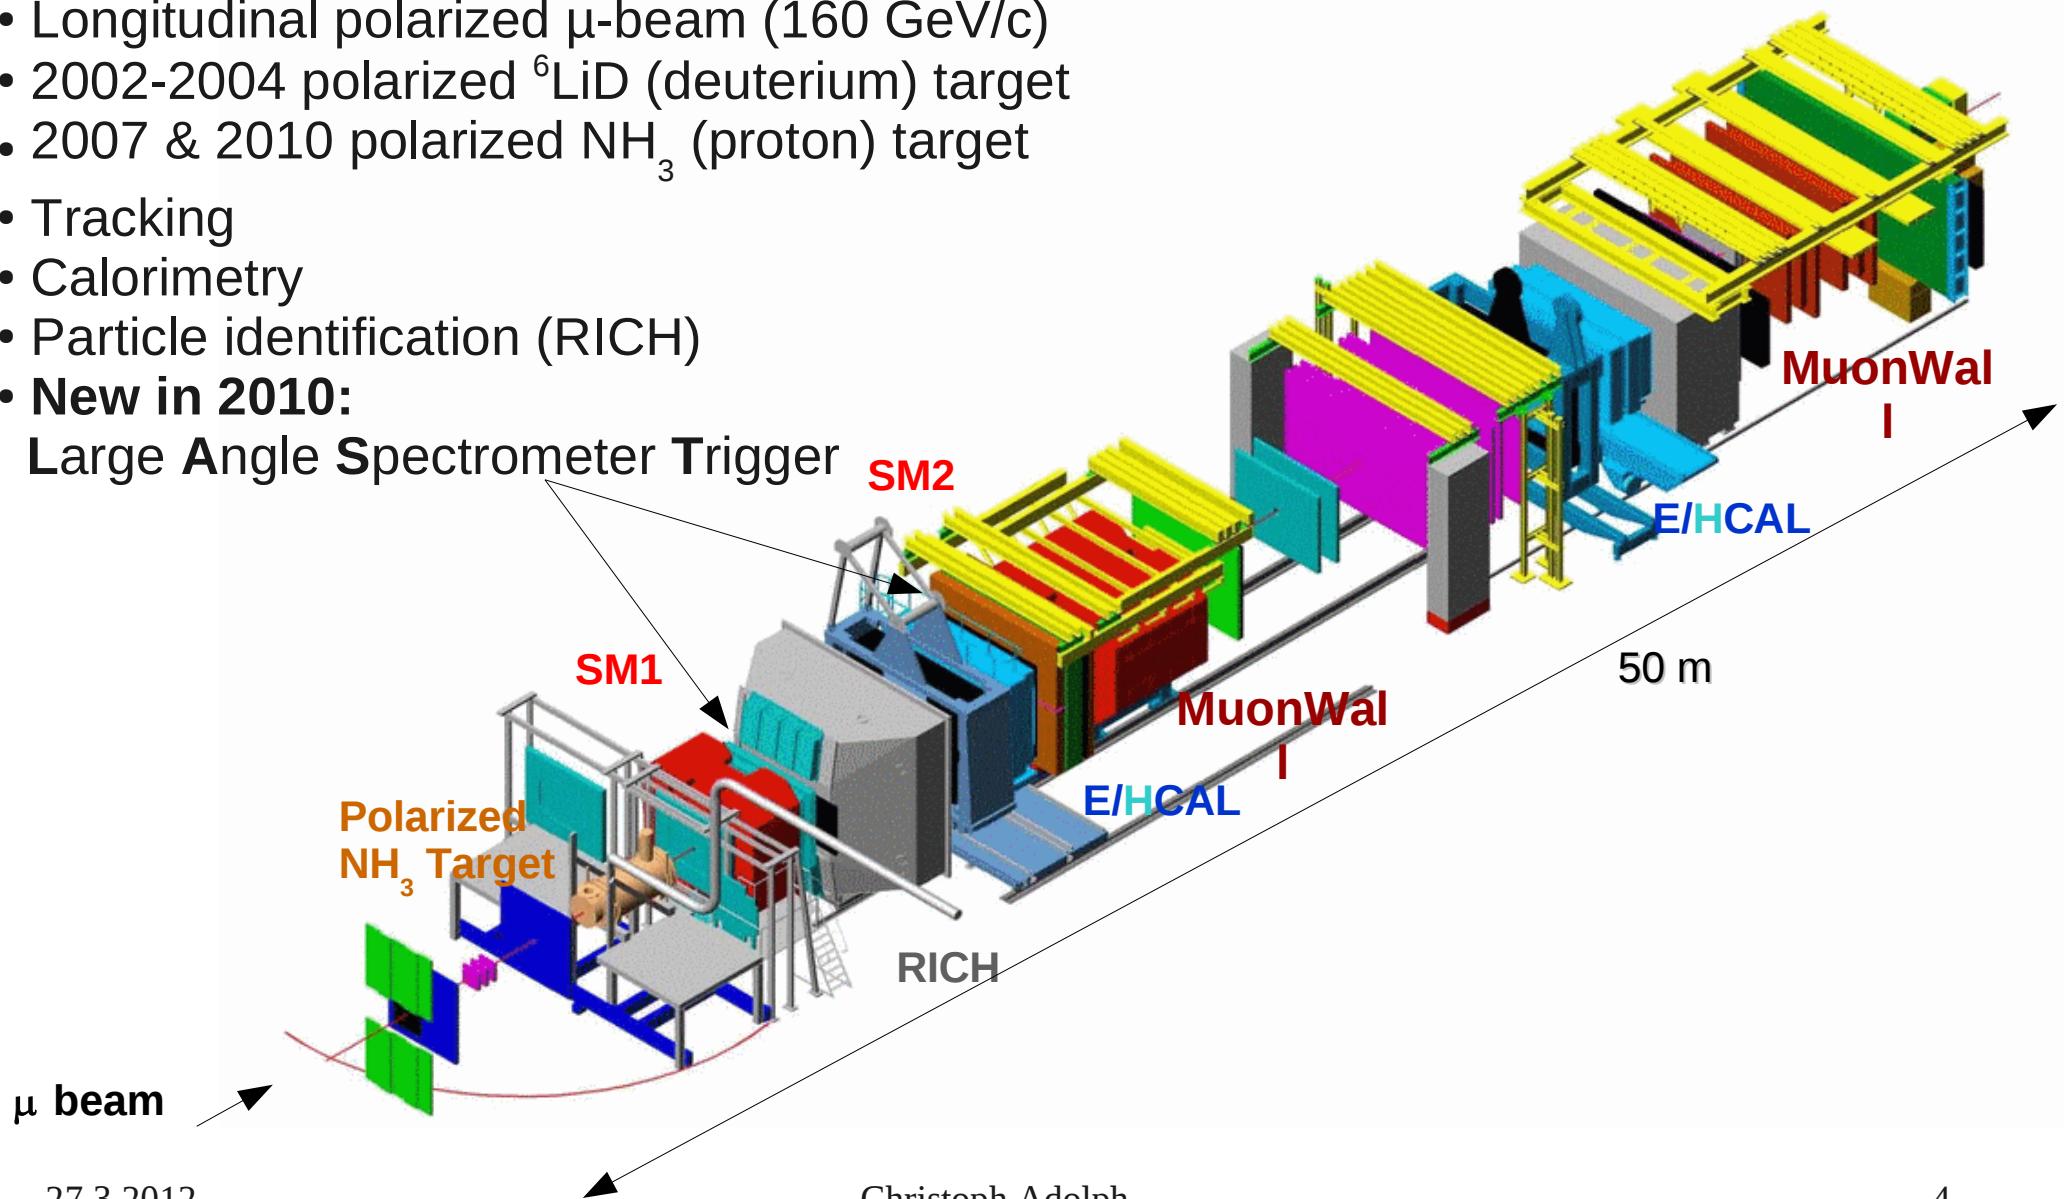

- The COMPASS experiment
- Collins and Sivers asymmetries from 2010 run
- Asymmetries at low z and low y
- Summary and Outlook

The COMPASS experiment at CERN

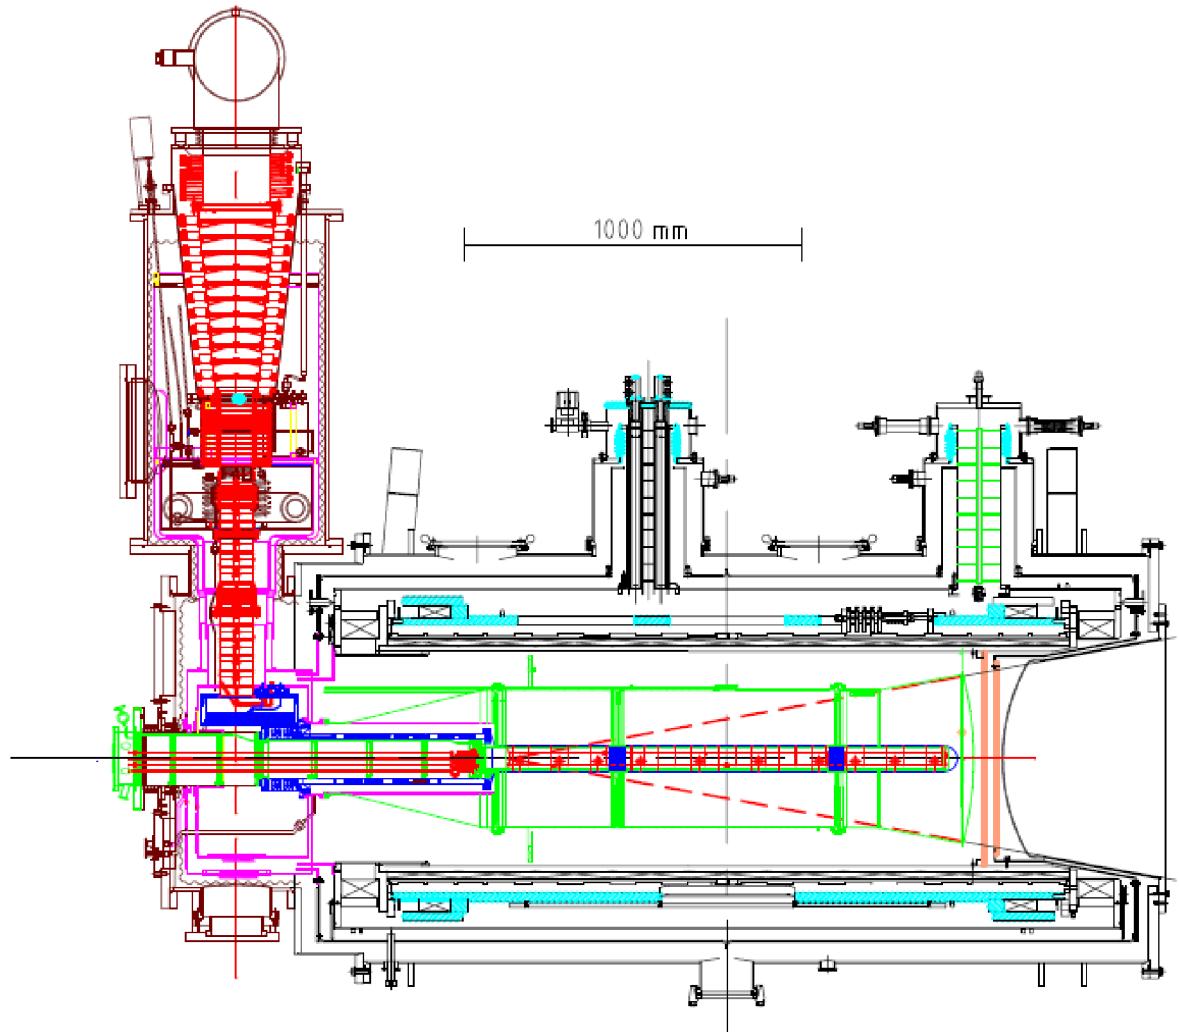

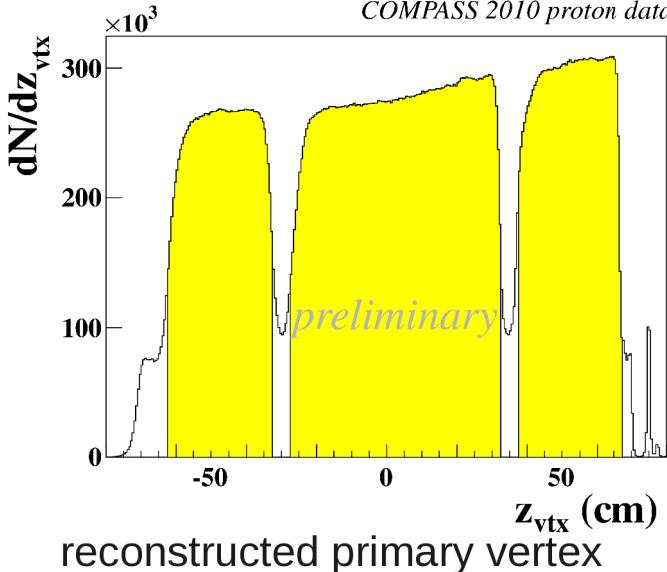

The COMPASS spectrometer in 2010

- Two stage spectrometer
- Longitudinal polarized μ -beam (160 GeV/c)
- 2002-2004 polarized ${}^6\text{LiD}$ (deuterium) target
- 2007 & 2010 polarized NH_3 (proton) target
- Tracking
- Calorimetry
- Particle identification (RICH)
- **New in 2010:**
Large Angle Spectrometer Trigger

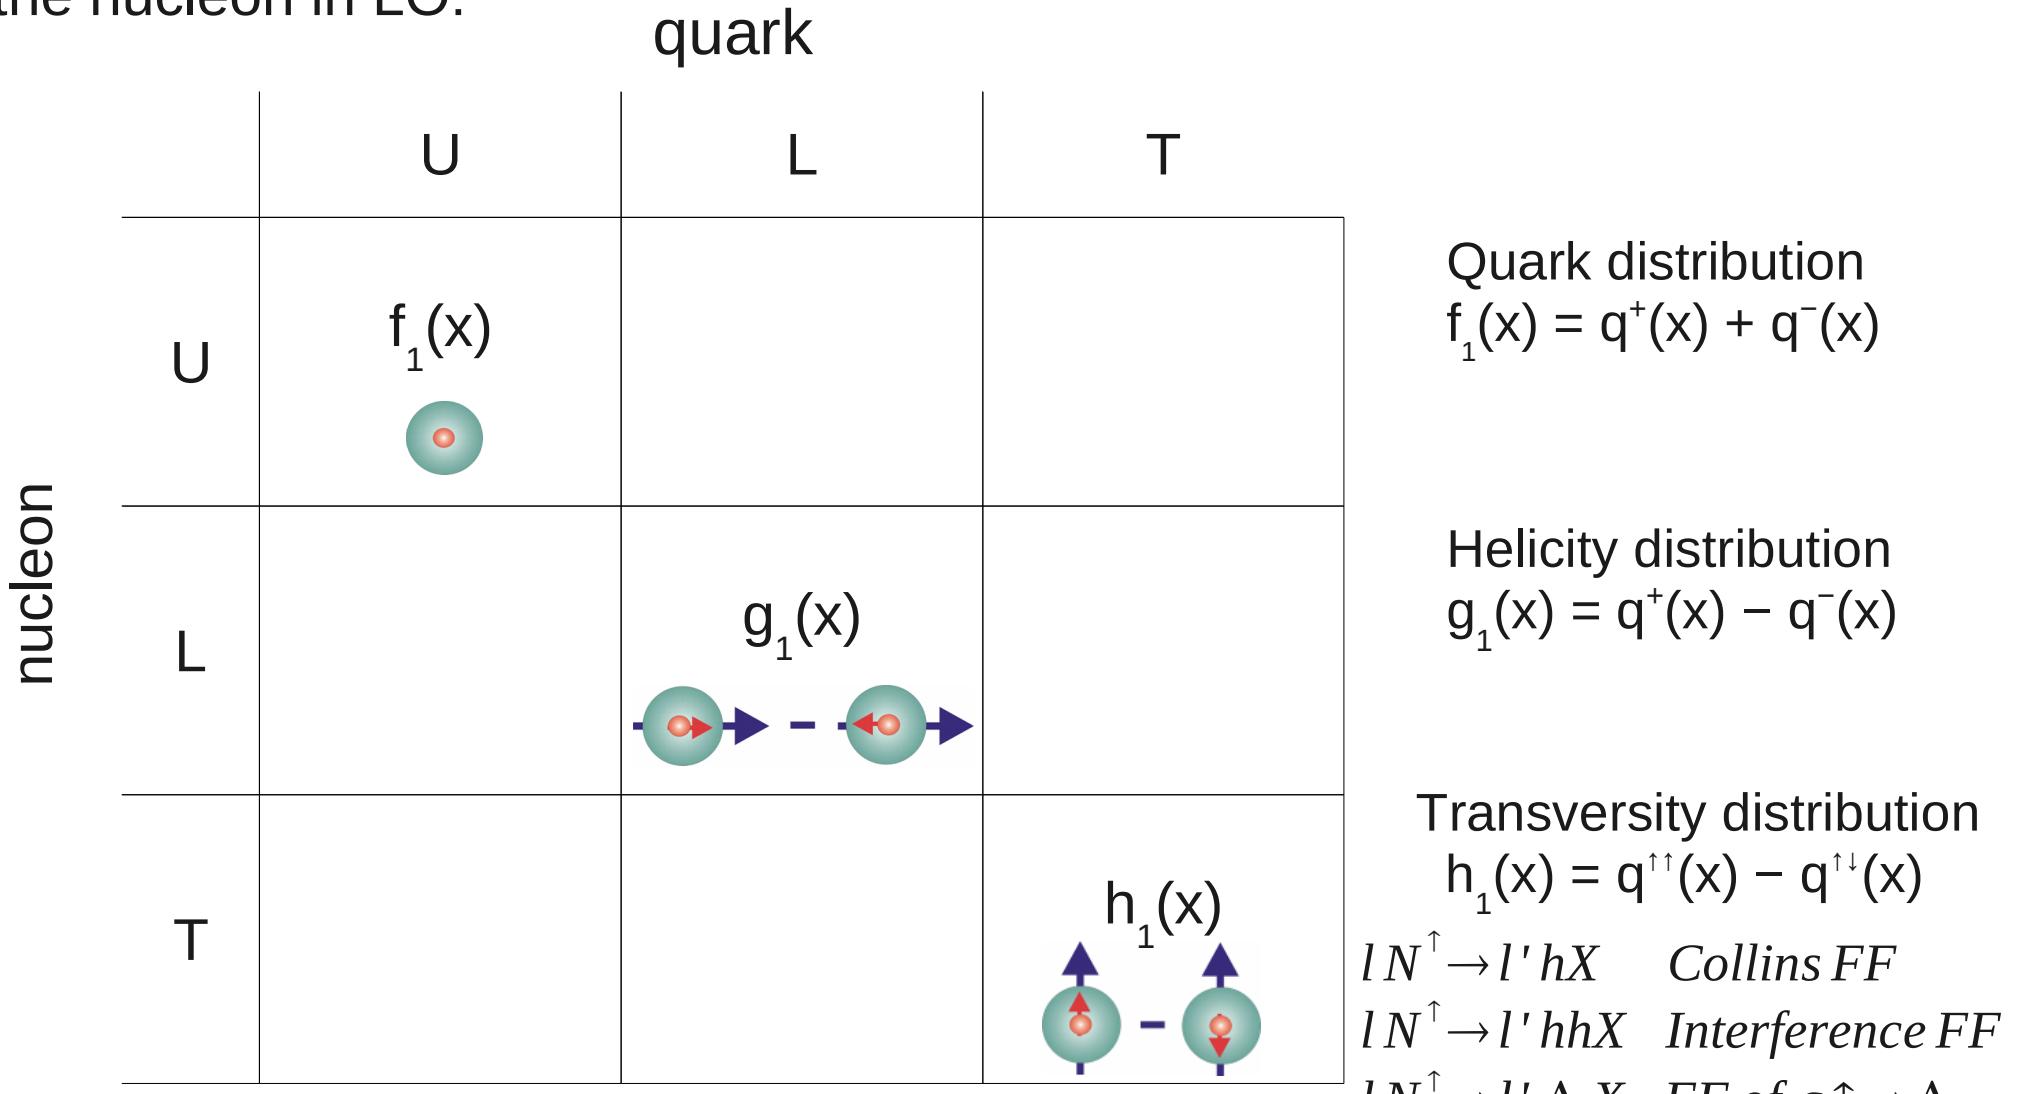

The COMPASS polarized target system

- Upgrade of target system in 2005
- Three cells with opposite polarisation (2002-04 two cells)
- $\pm 180\text{mrad}$ geometrical acceptance
- ${}^6\text{LiD}$:
 - polarization: ~50%
 - dilution factor: ~0.40
- NH_3 :
 - polarization: ~90%
 - dilution factor: ~0.15
- Transverse polarization reversed every week via microwave

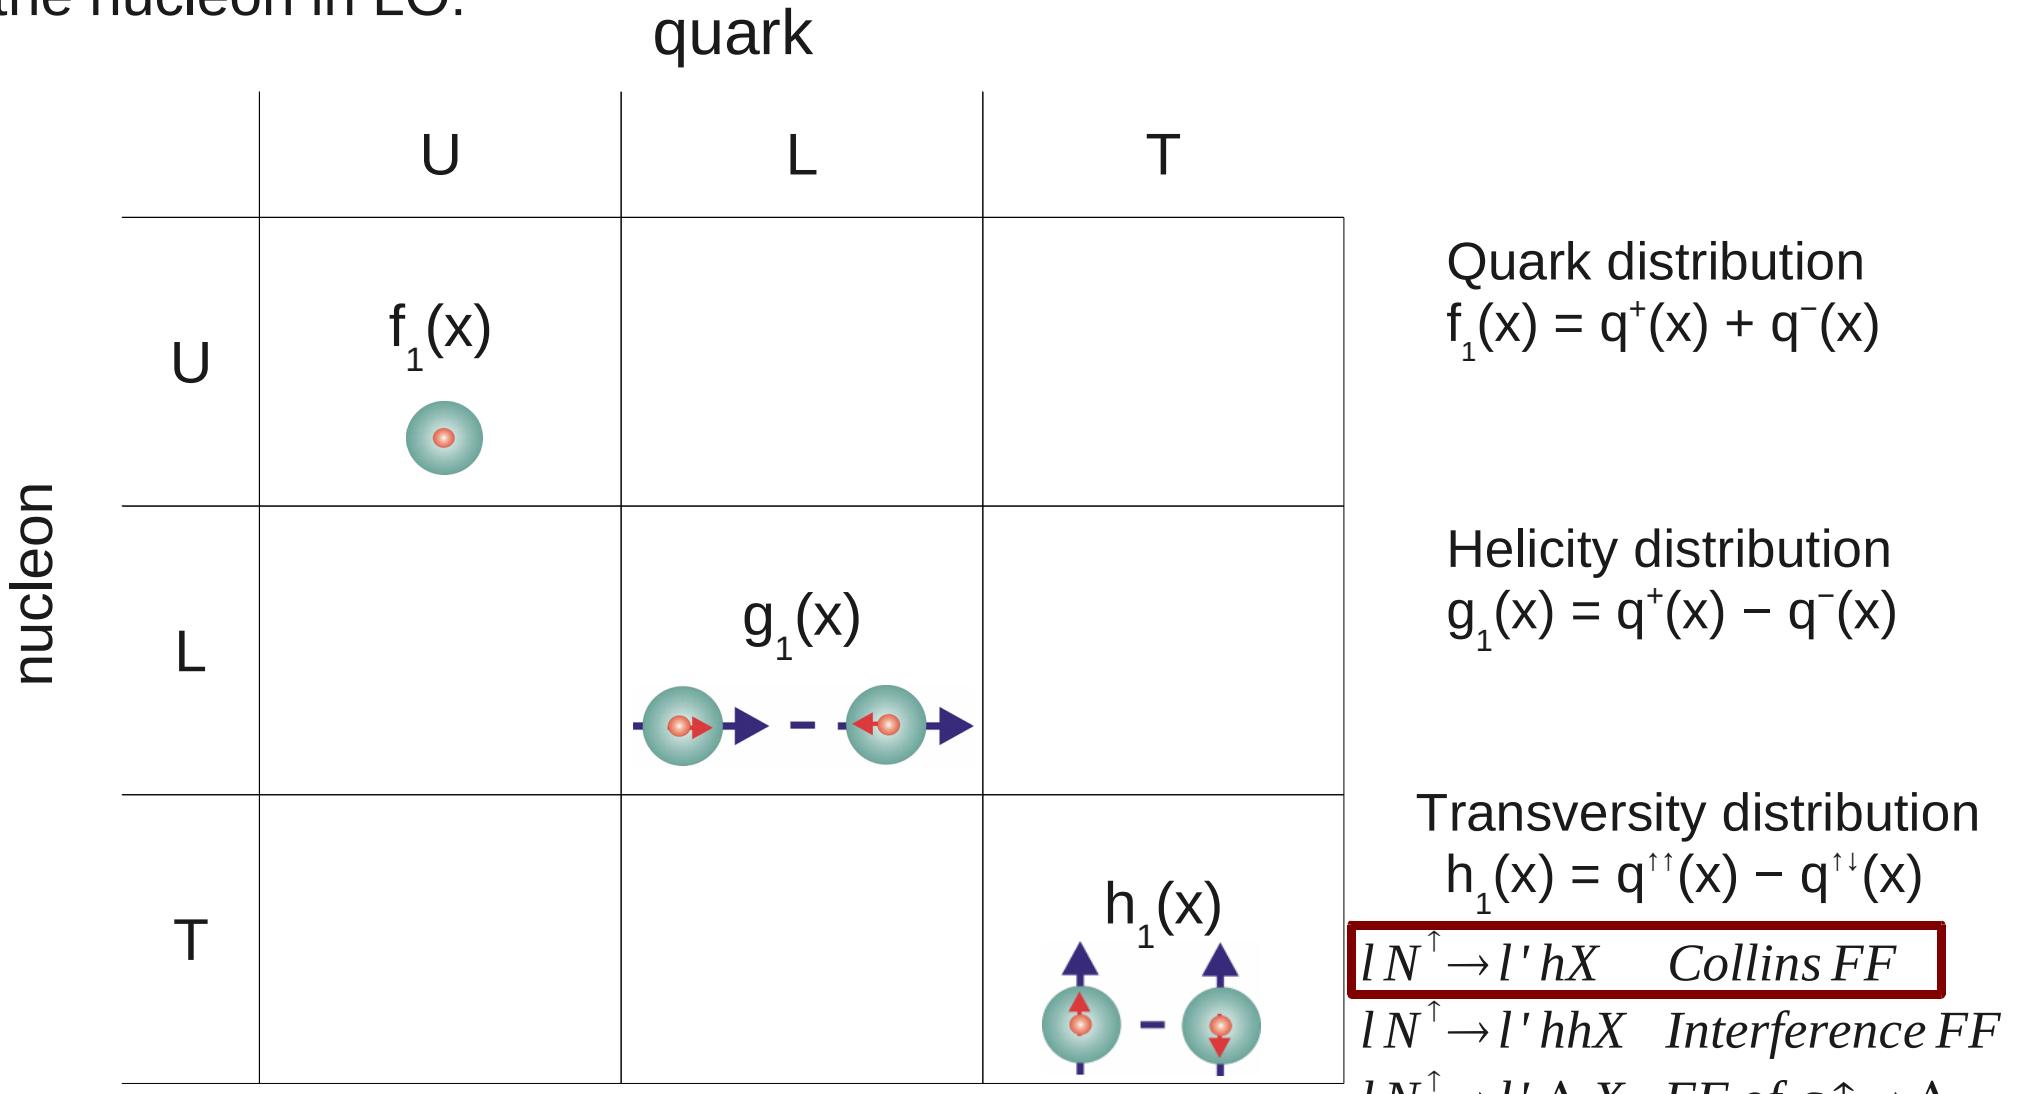

Spin structure → Transversity

Three distribution functions are necessary to describe the spin structure of the nucleon in LO:

Spin structure → Transversity

Three distribution functions are necessary to describe the spin structure of the nucleon in LO:

The Collins modulation

For measuring Transversity quark spin must flip:

→ $h_1(x)$ decouples from inclusive DIS

Product of $h_1(x)$ and another chiral-odd function needed: Collins FF H_{1q}^h

→ $h_1(x)$ can be extracted via SIDIS on a transversely polarized target.

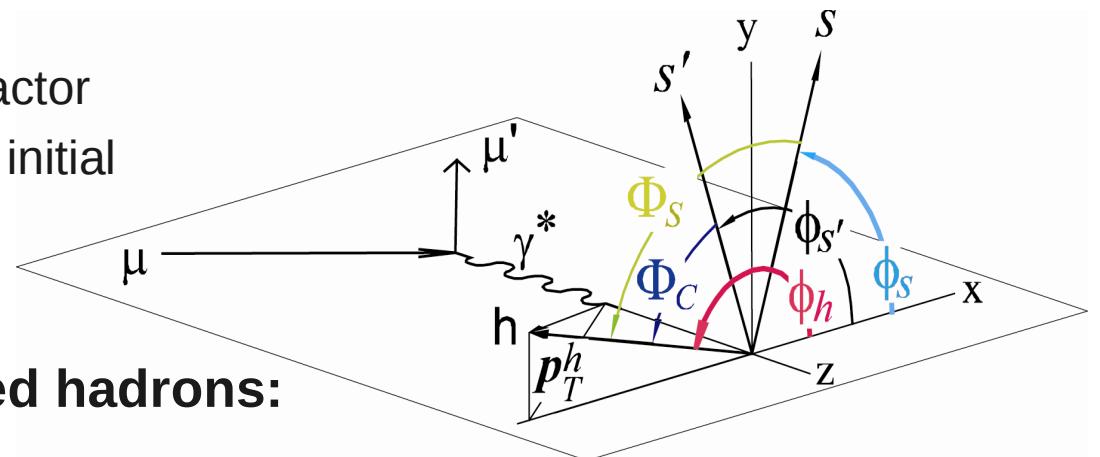

$$A_{Coll} = \frac{A_C^h}{f \cdot P_T \cdot D_{nn}} = \frac{\sum_q e_q^2 \cdot h_1 \cdot H_{1q}^h}{\sum_q e_q^2 \cdot f_1 \cdot D_q^h}$$

with P_T the target polarization, f the dilution factor
and D_{NN} the spin transfer coefficient from the initial
to the struck quark

Azimuthal distribution of the produced hadrons:

$$N_h^\pm(\Phi_C) = N_h^0(1 \pm A_C^h \sin(\Phi_C))$$

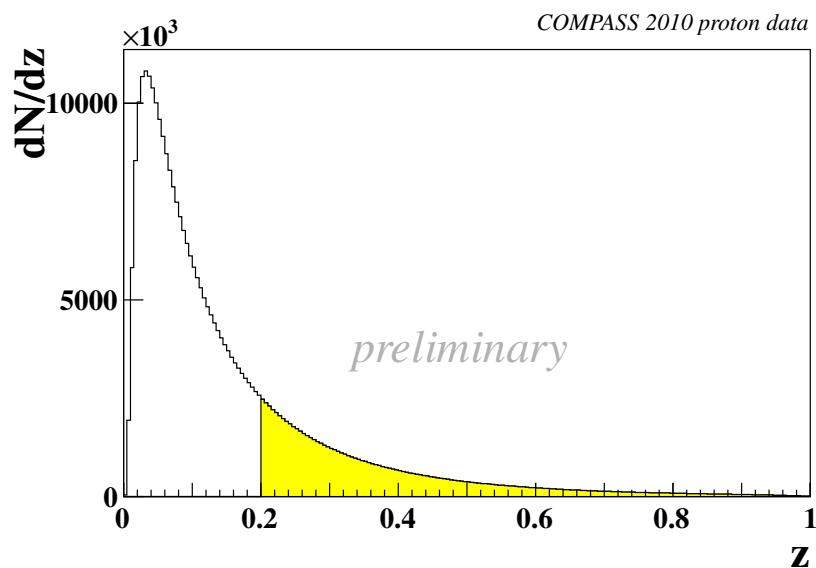

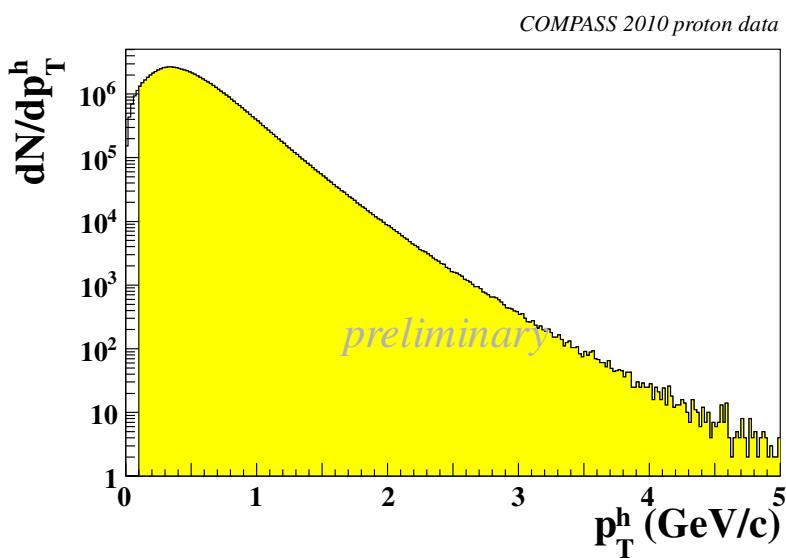

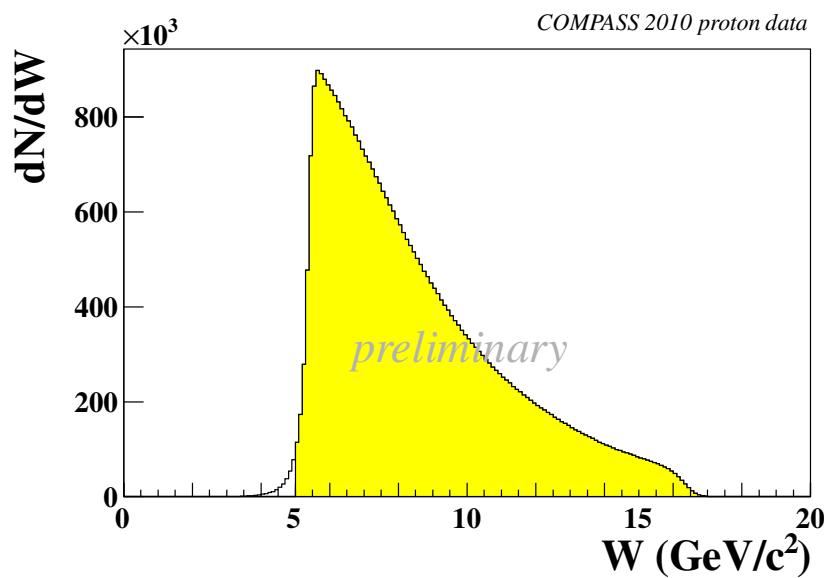

$$\text{with } \Phi_C = \phi_h - \phi_{s'} = \phi_h + \phi_s - \pi$$

SIDIS event selection

Standard cuts like in 2007:
DIS cuts: $Q^2 > 1 \text{ (GeV/c)}^2$
 $0.1 < y < 0.9$
 $W > 5 \text{ GeV/c}^2$

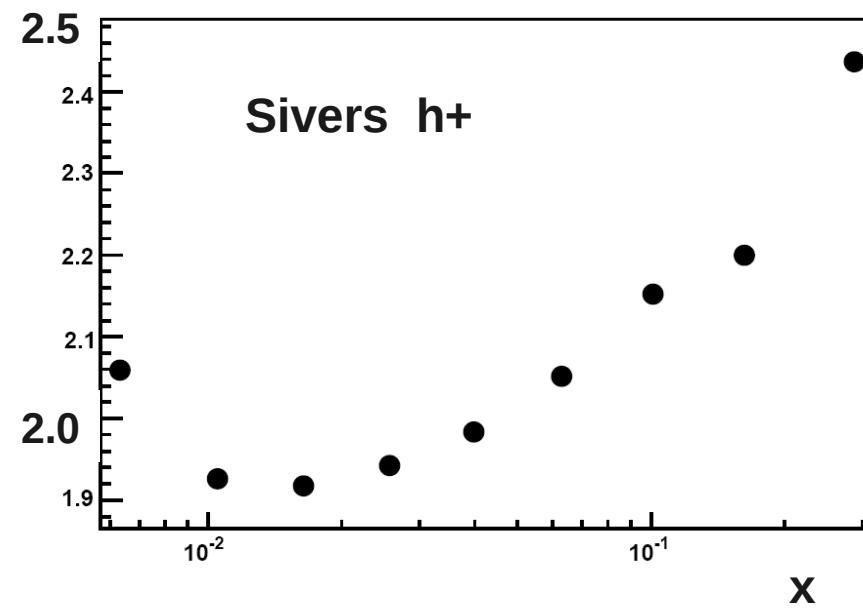

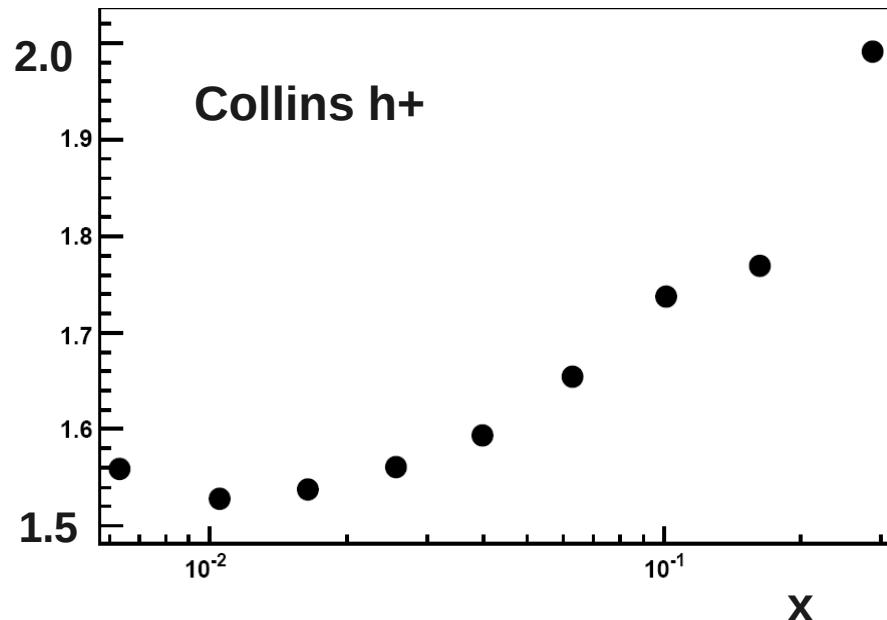

Hadron selection:
 $p_t^h > 0.1 \text{ GeV/c}$
 $z > 0.2$

2010 Hadron statistics

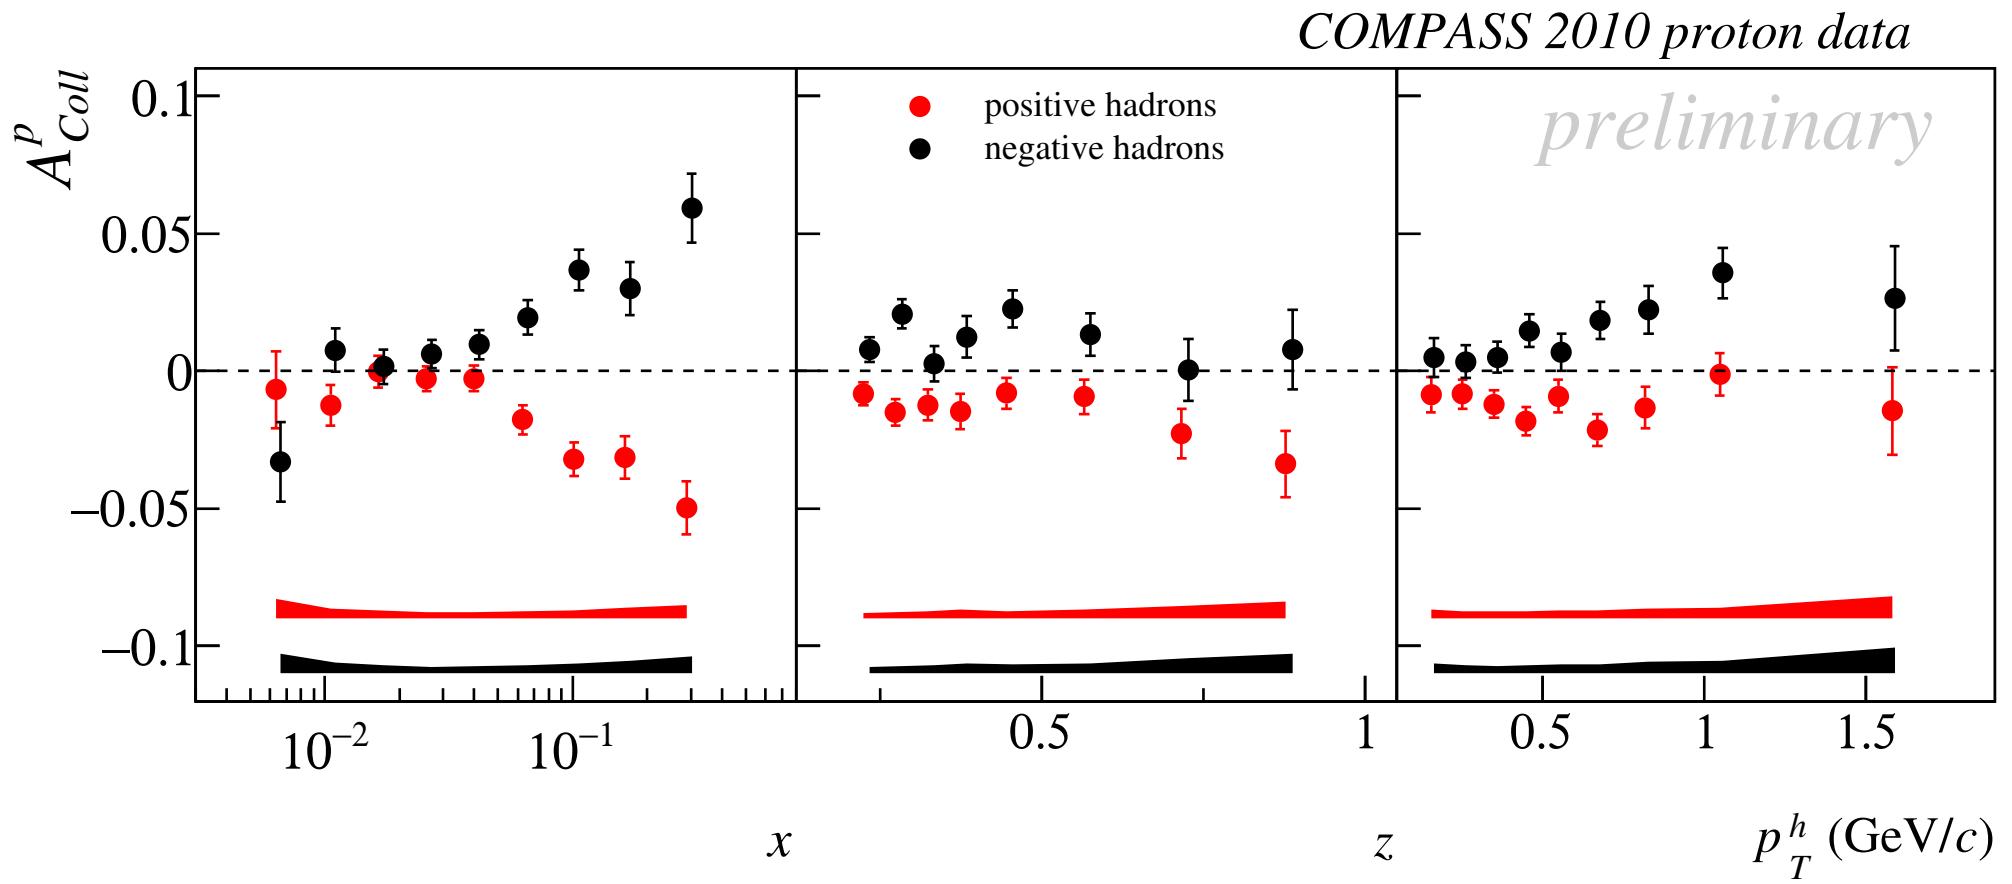

positive hadrons: $43 \cdot 10^6$
negative hadrons: $34 \cdot 10^6$

ratio of statistical errors: 2007 / 2010

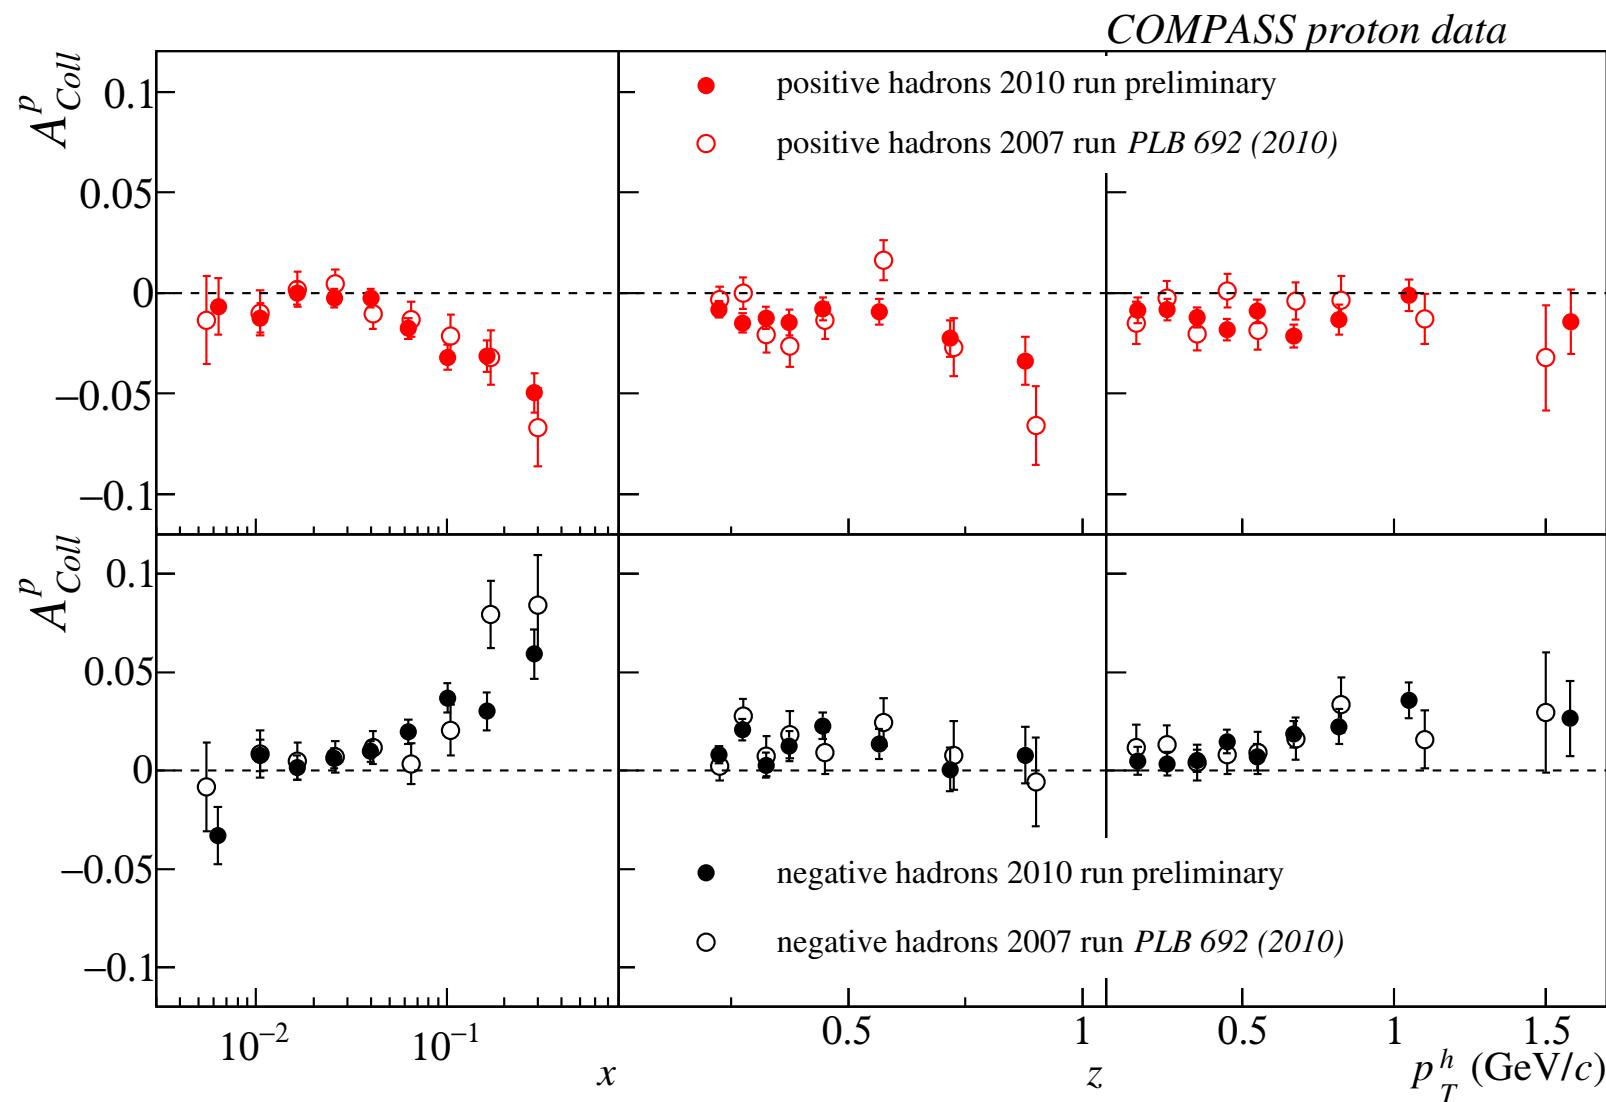

The Collins modulation – 2010 data

- at small x asymmetries are compatible with zero
- Large signal in the valence region
of opposite sign for positive and negative hadrons

The Collins modulation

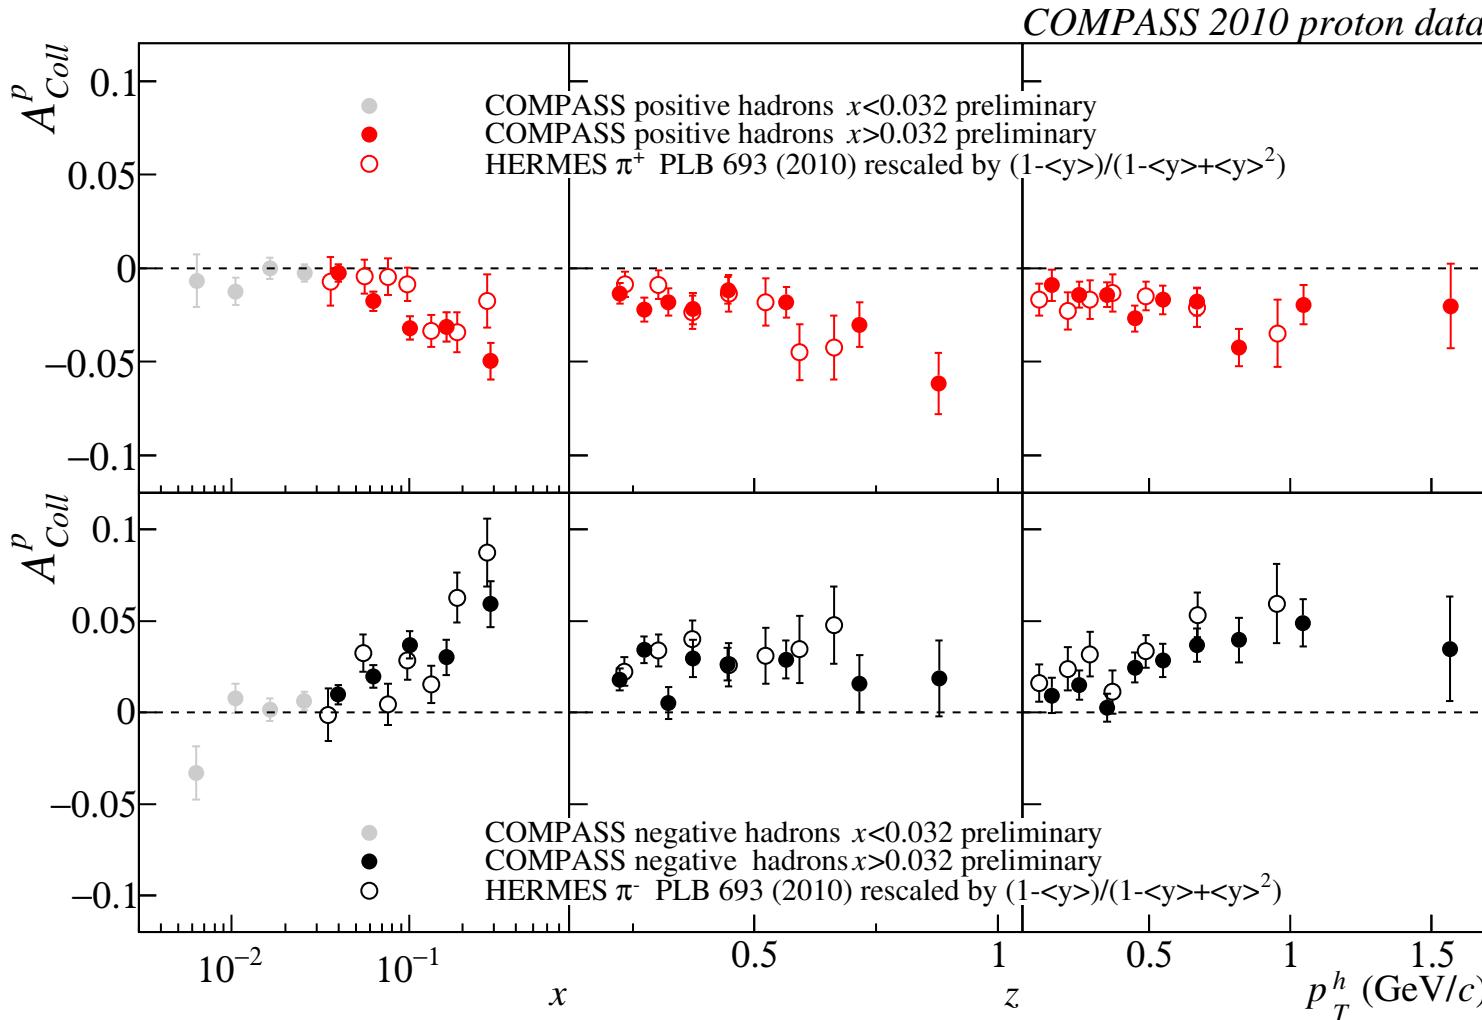

2010 \leftrightarrow 2007

confirmation of 2007 results with increased statistics

The Collins modulation

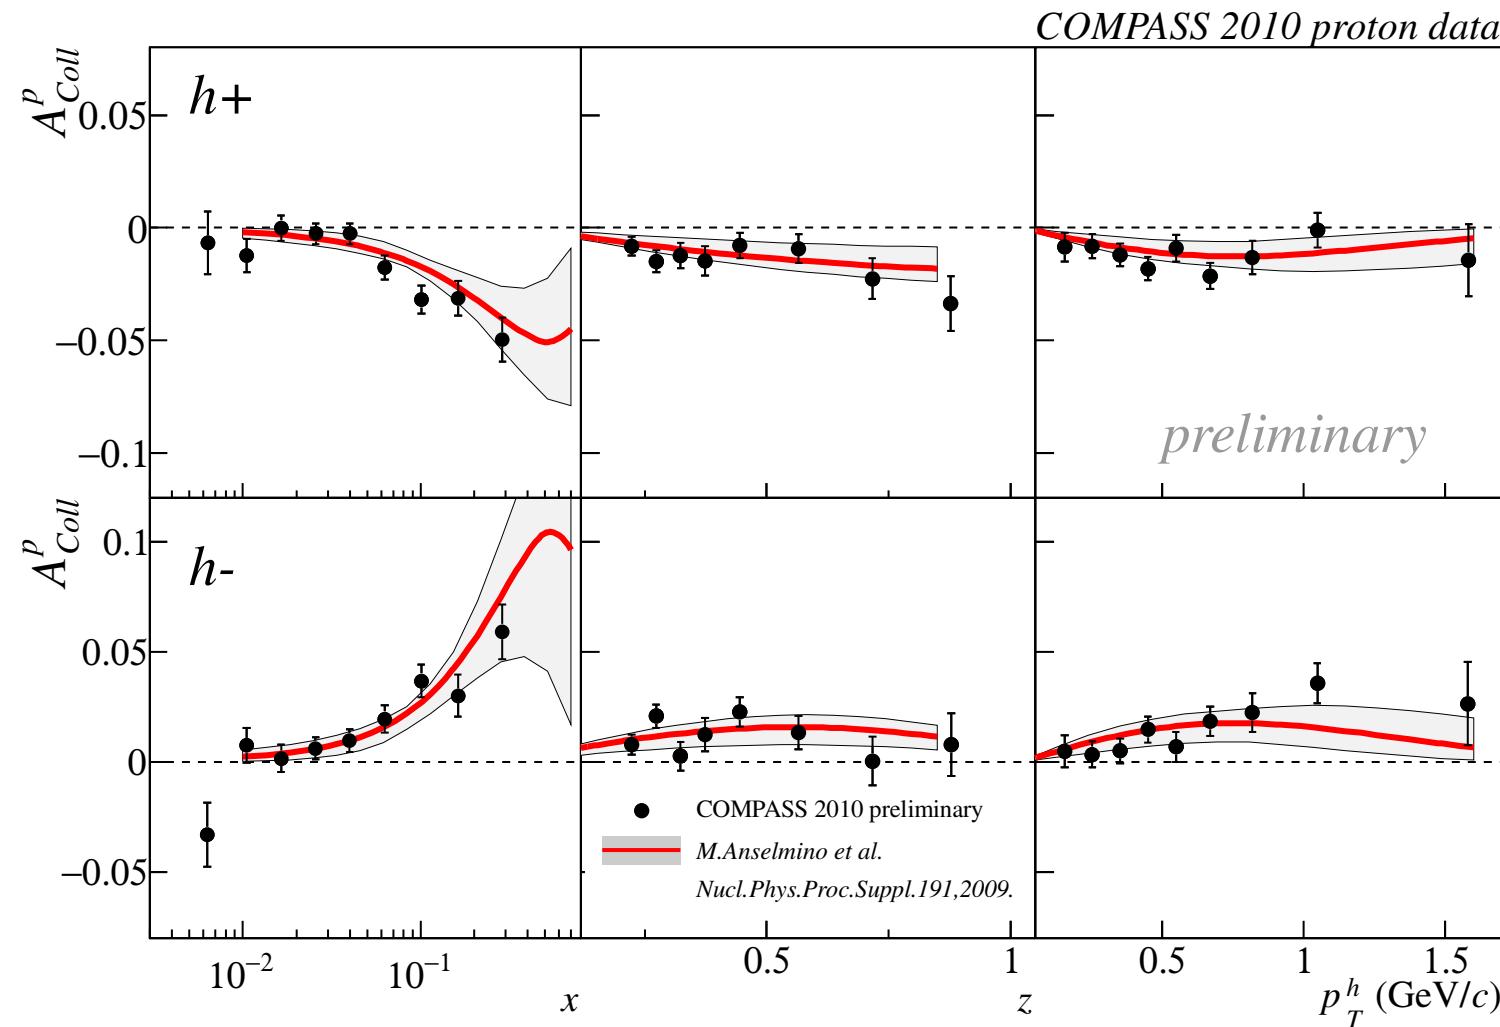

Comparison to HERMES data for $x > 0.032$

nice agreement between COMPASS and HERMES

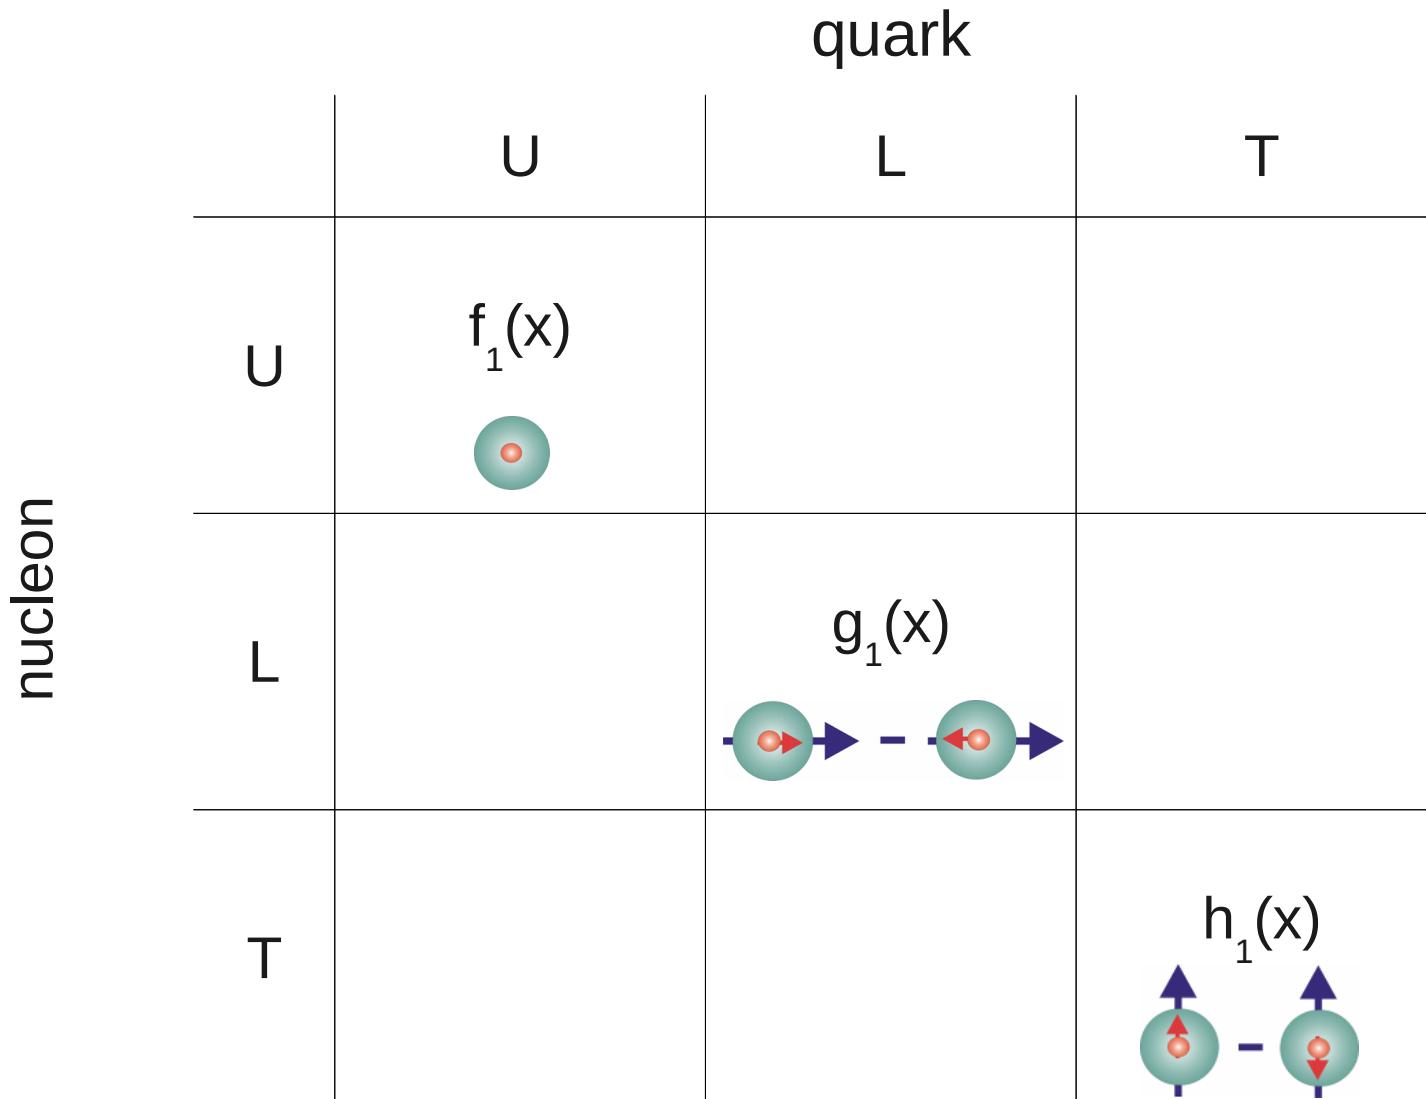

The Collins modulation Comparison to model predictions

Comparison with the predictions from the fit to the COMPASS deuteron data,
HERMES proton SIDIS data and BELLE e⁺e⁻ data (Anselmino et al.):

Transverse spin physics

Taking into account the transverse momentum k_T of the quarks:

Transverse spin physics: TMDs

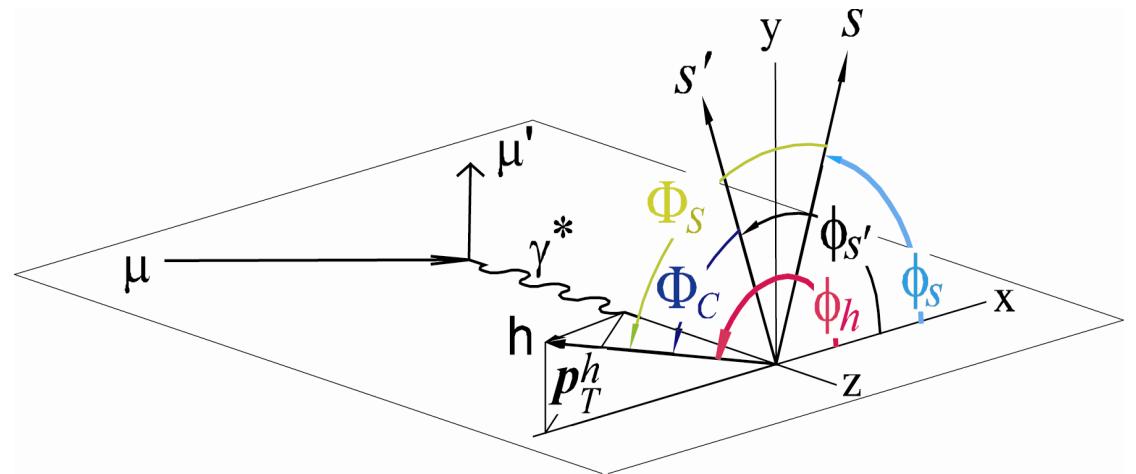

Taking into account the transverse momentum k_T of the quarks:

		quark		
		U	L	T
nucleon	U	$f_1(x, k_T)$		$h_1^\perp(x, k_T)$ Boer-Mulders
	L		$g_1(x, k_T)$	$h_{1L}(x, k_T)$ Worm-gear 1
	T	$f_{1T}^\perp(x, k_T)$ Sivers	$g_{1T}(x, k_T)$ Worm-gear 2	$h_{1T}(x, k_T)$ Transversity $h_{1T}^\perp(x, k_T)$ Pretzelosity

The Sivers modulation

Sivers function $f_{1T}^{\perp}(x, k_T)$: Correlation between the transverse spin of a nucleon and the intrinsic transverse momentum of unpolarized quarks

$$A_{Siv} = \frac{A_S^h}{f \cdot P_T} = \frac{\sum_q e_q^2 \cdot f_{1Tq}^{\perp} D_q^h}{\sum_q e_q^2 \cdot f_{1q} \cdot D_q^h}$$

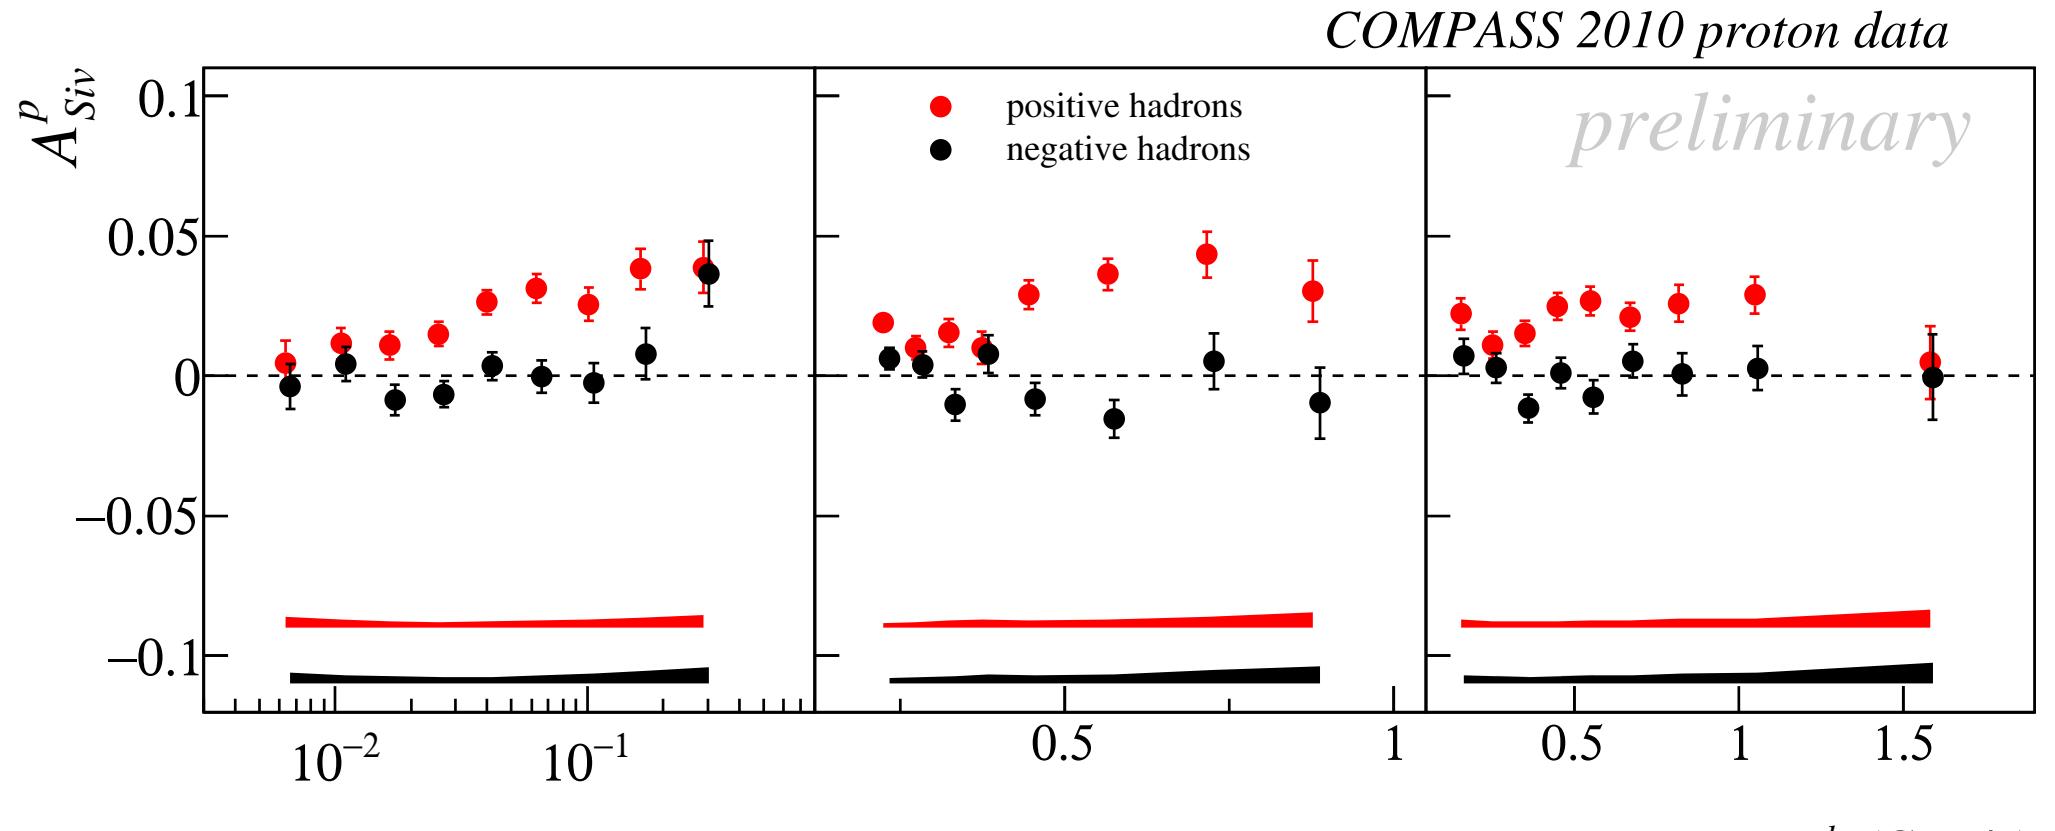

Azimuthal distribution of the produced hadrons:

$$N_h^{\pm}(\Phi_C) = N_h^0(1 \pm A_S^h \sin(\Phi_S))$$

with $\Phi_S = \phi_h - \phi_s$

The Sivers modulation – 2010 data

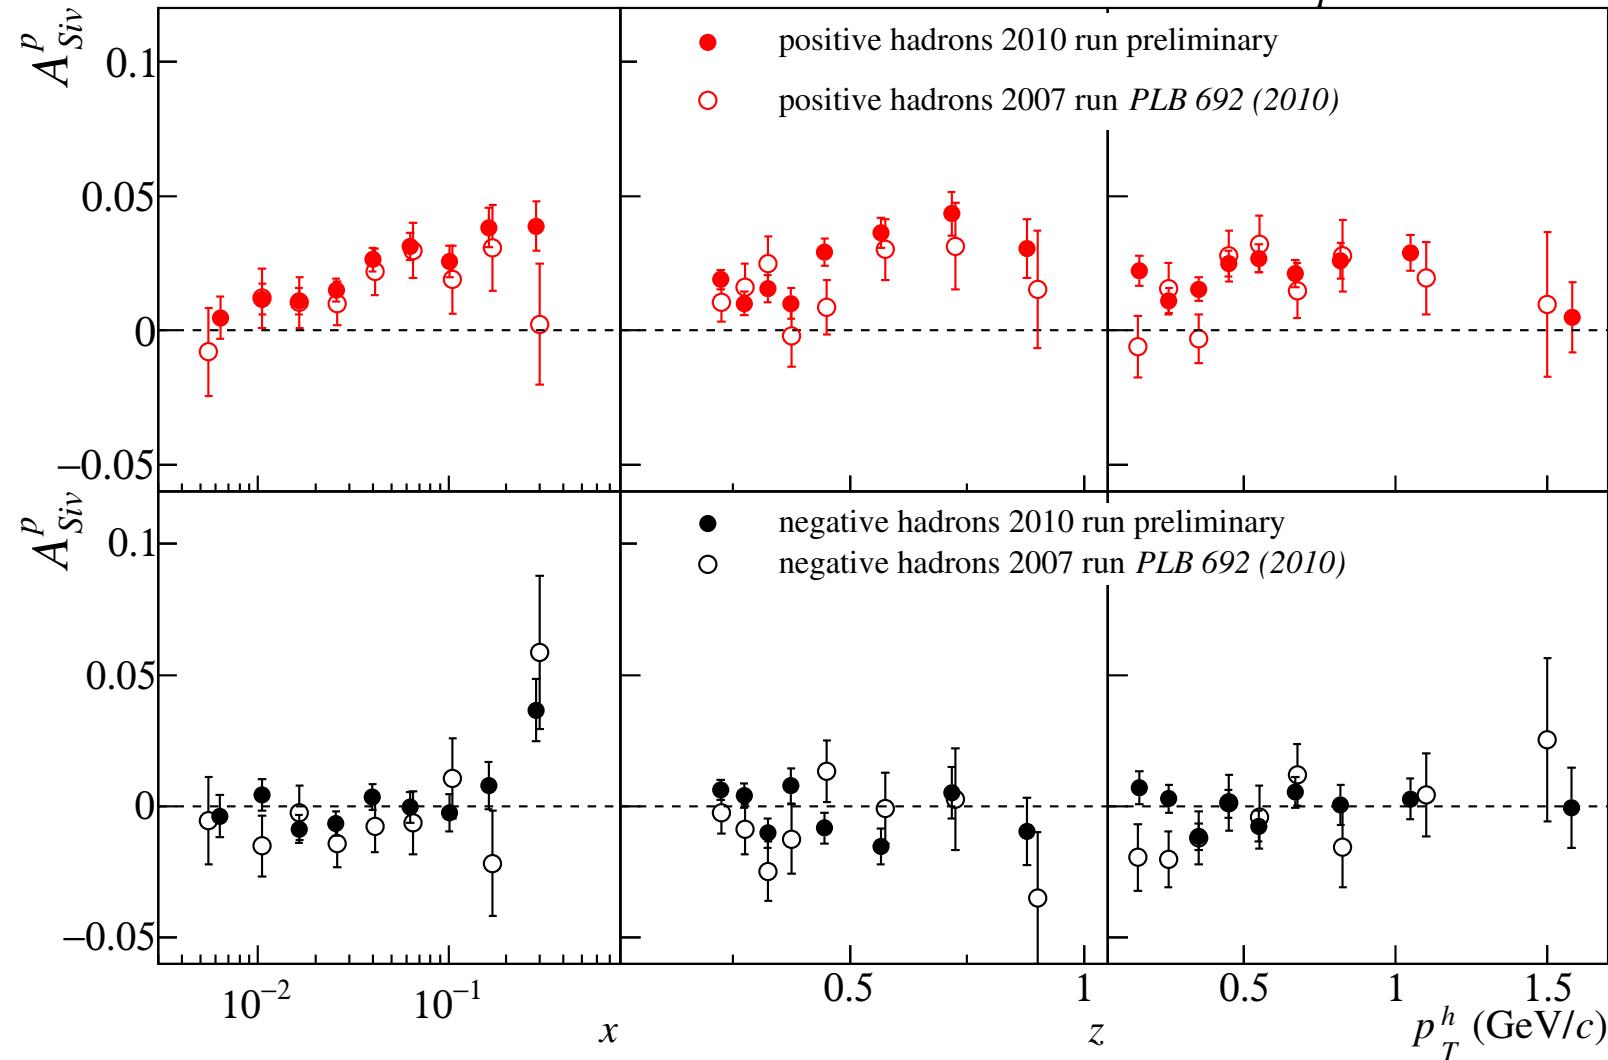

- positive signal for positive hadrons
- h^- asymmetry compatible with zero

$$\sigma_{\text{syst}} \sim 0.5 \sigma_{\text{stat}}$$

The Sivers modulation

2010 \leftrightarrow 2007

COMPASS proton data

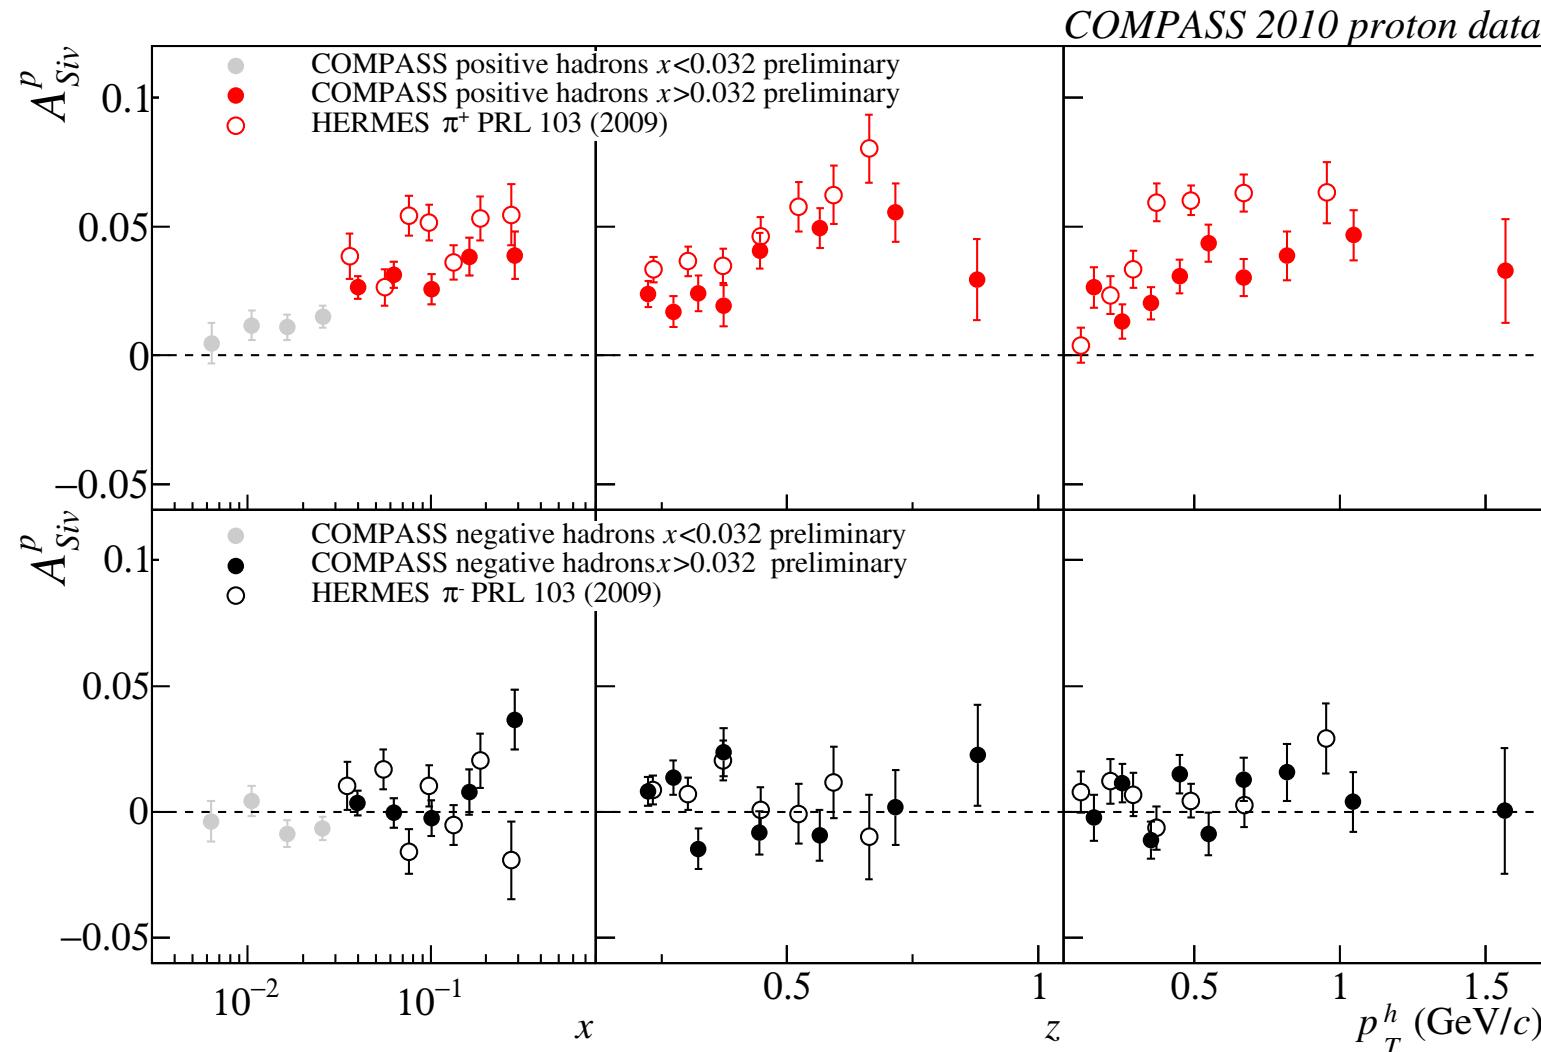

good agreement with 2007 published results, but with smaller errors

The Sivers modulation

Comparison to HERMES data

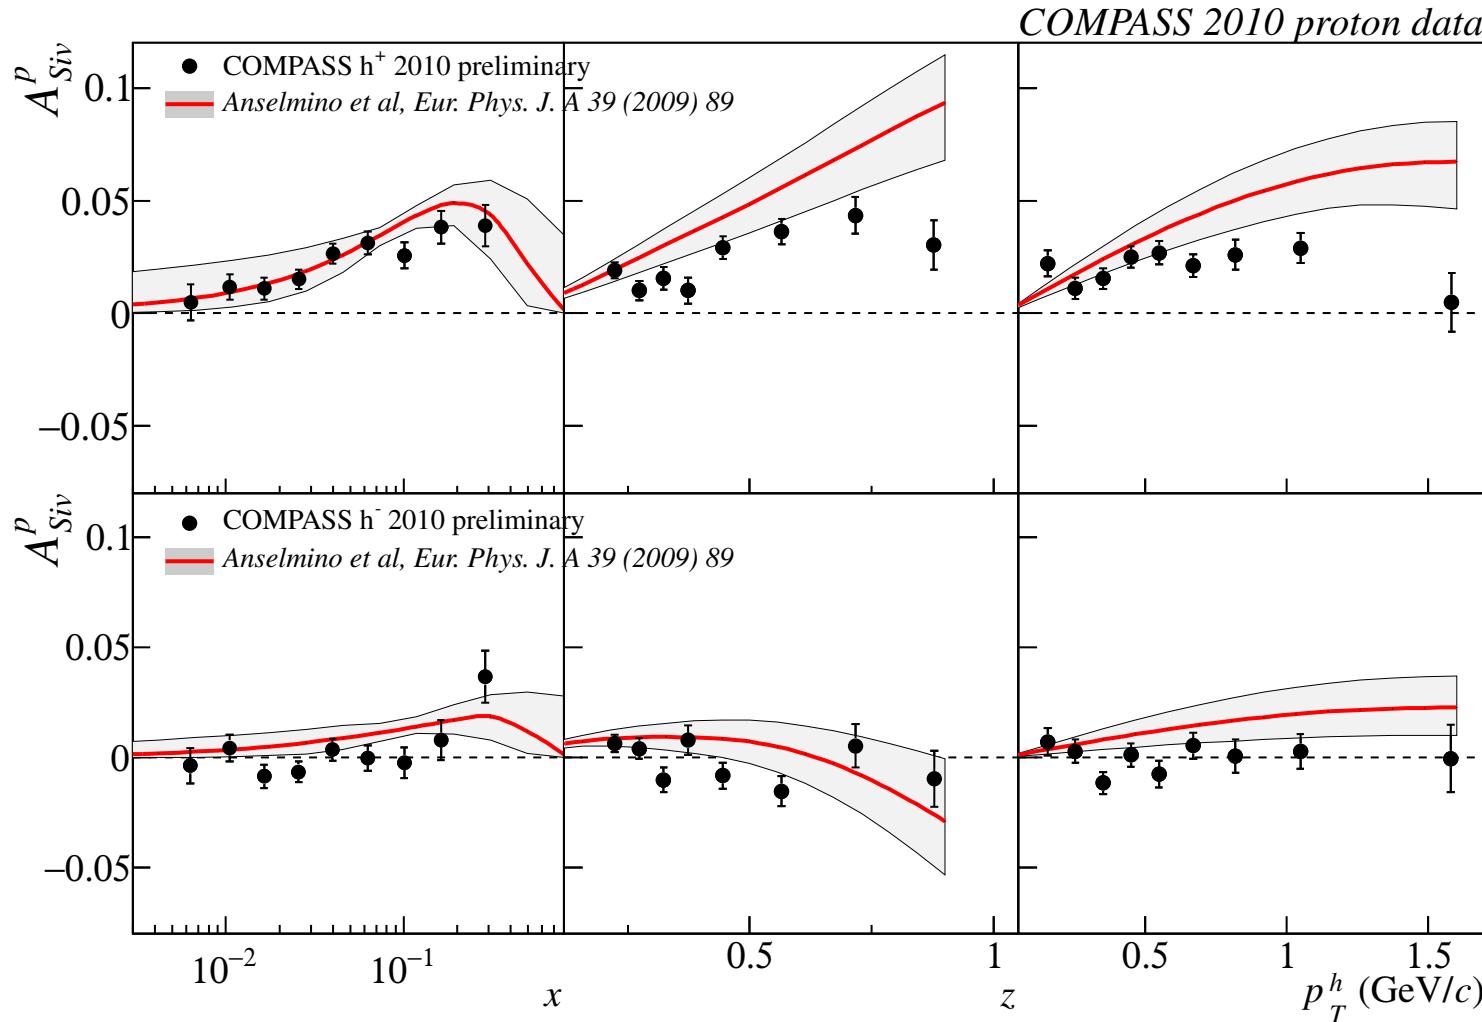

for $x > 0.032$

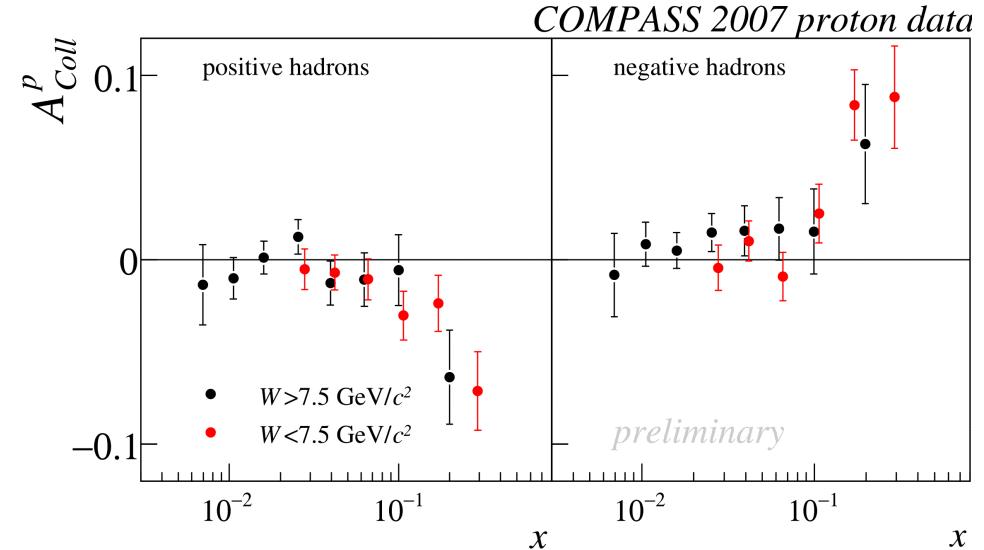

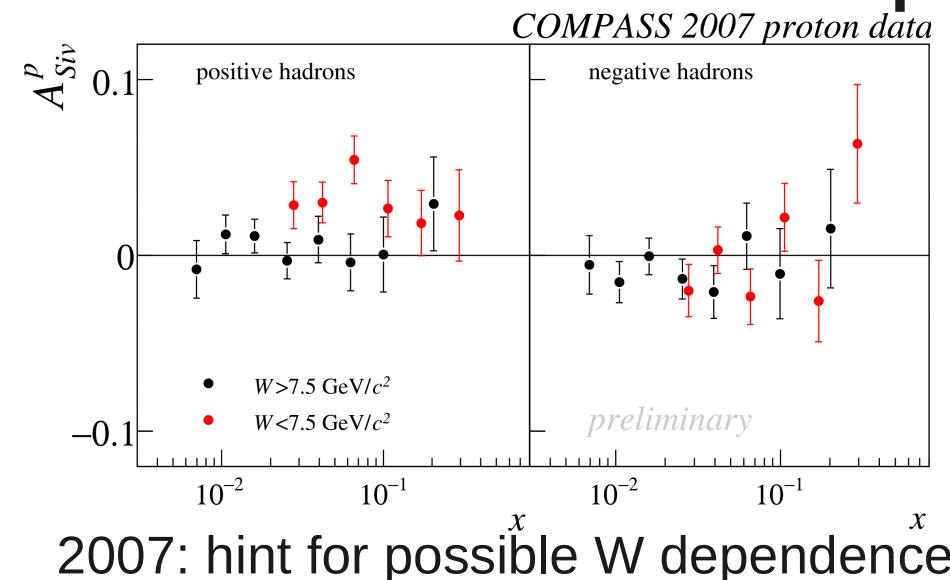

difference between COMPASS and HERMES results, but same trend

The Sivers modulation Comparison to model predictions

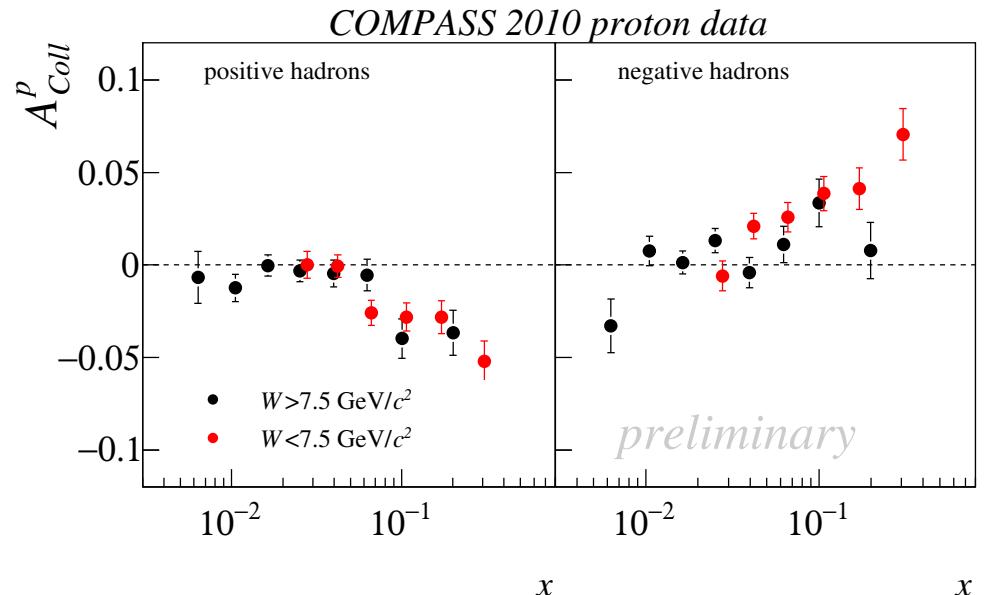

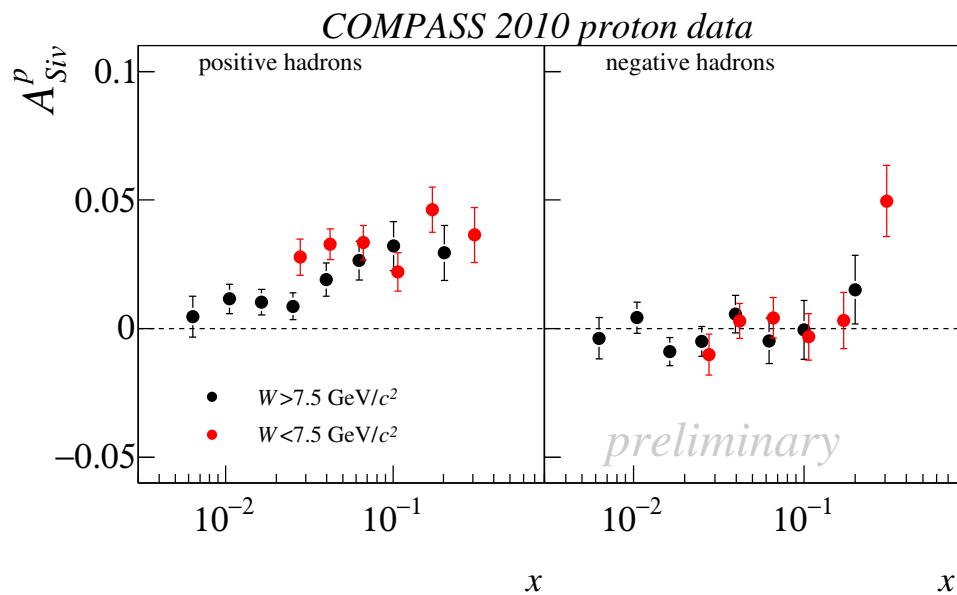

Comparison with the predictions from the fit to the COMPASS deuteron and HERMES proton SIDIS data (Anselmino et al.):

W dependence

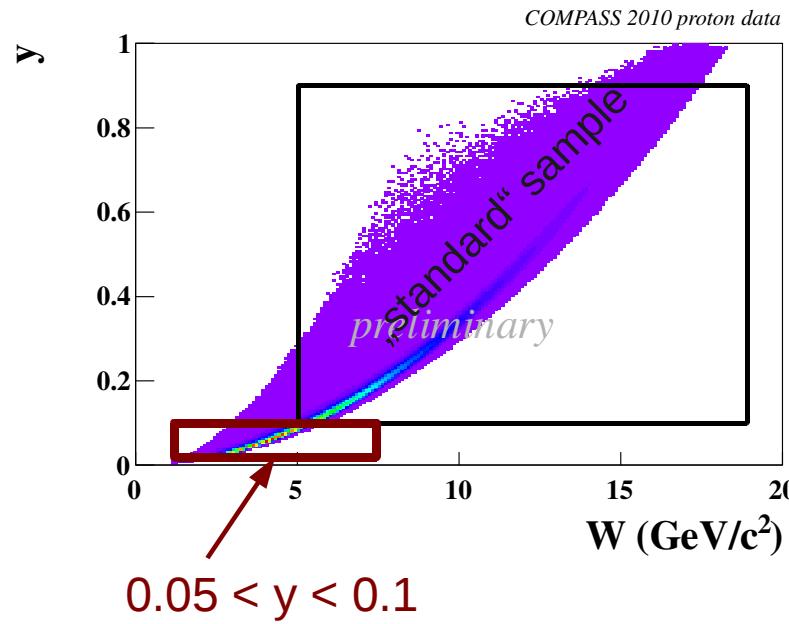

2007: hint for possible W dependence

2010: absolute difference smaller

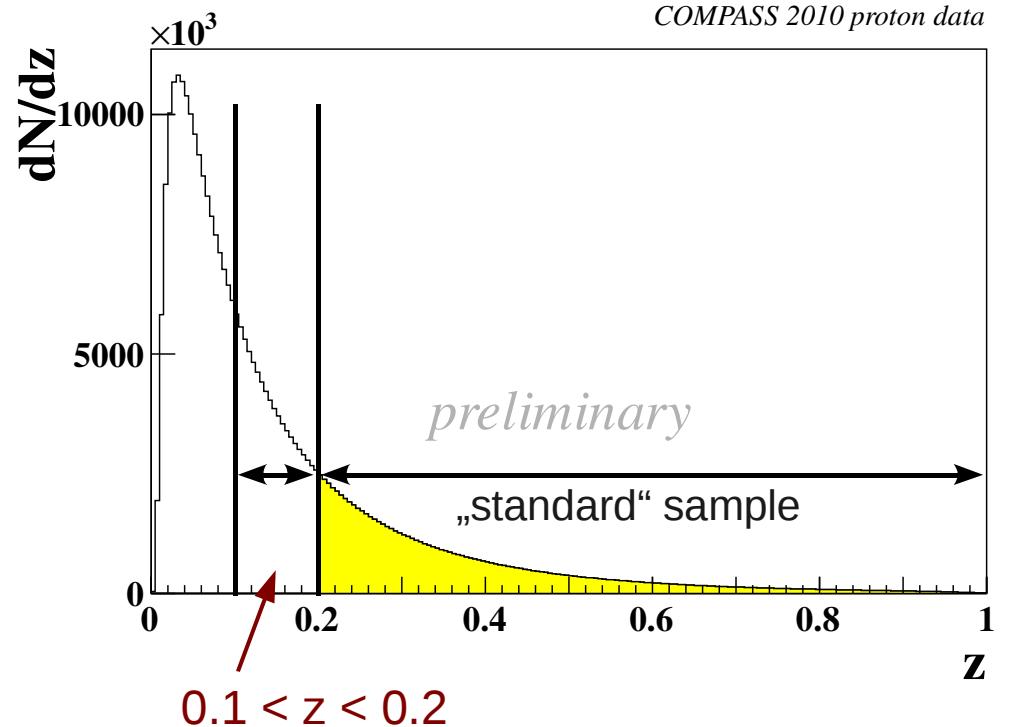

Exploration of different kinematic regions

low y : $0.05 < y < 0.1$

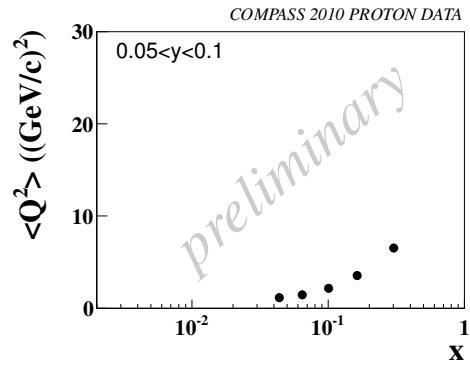

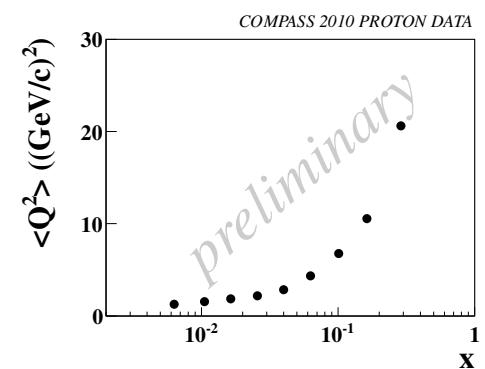

$0.05 < y < 0.1$

low z : $0.1 < z < 0.2$

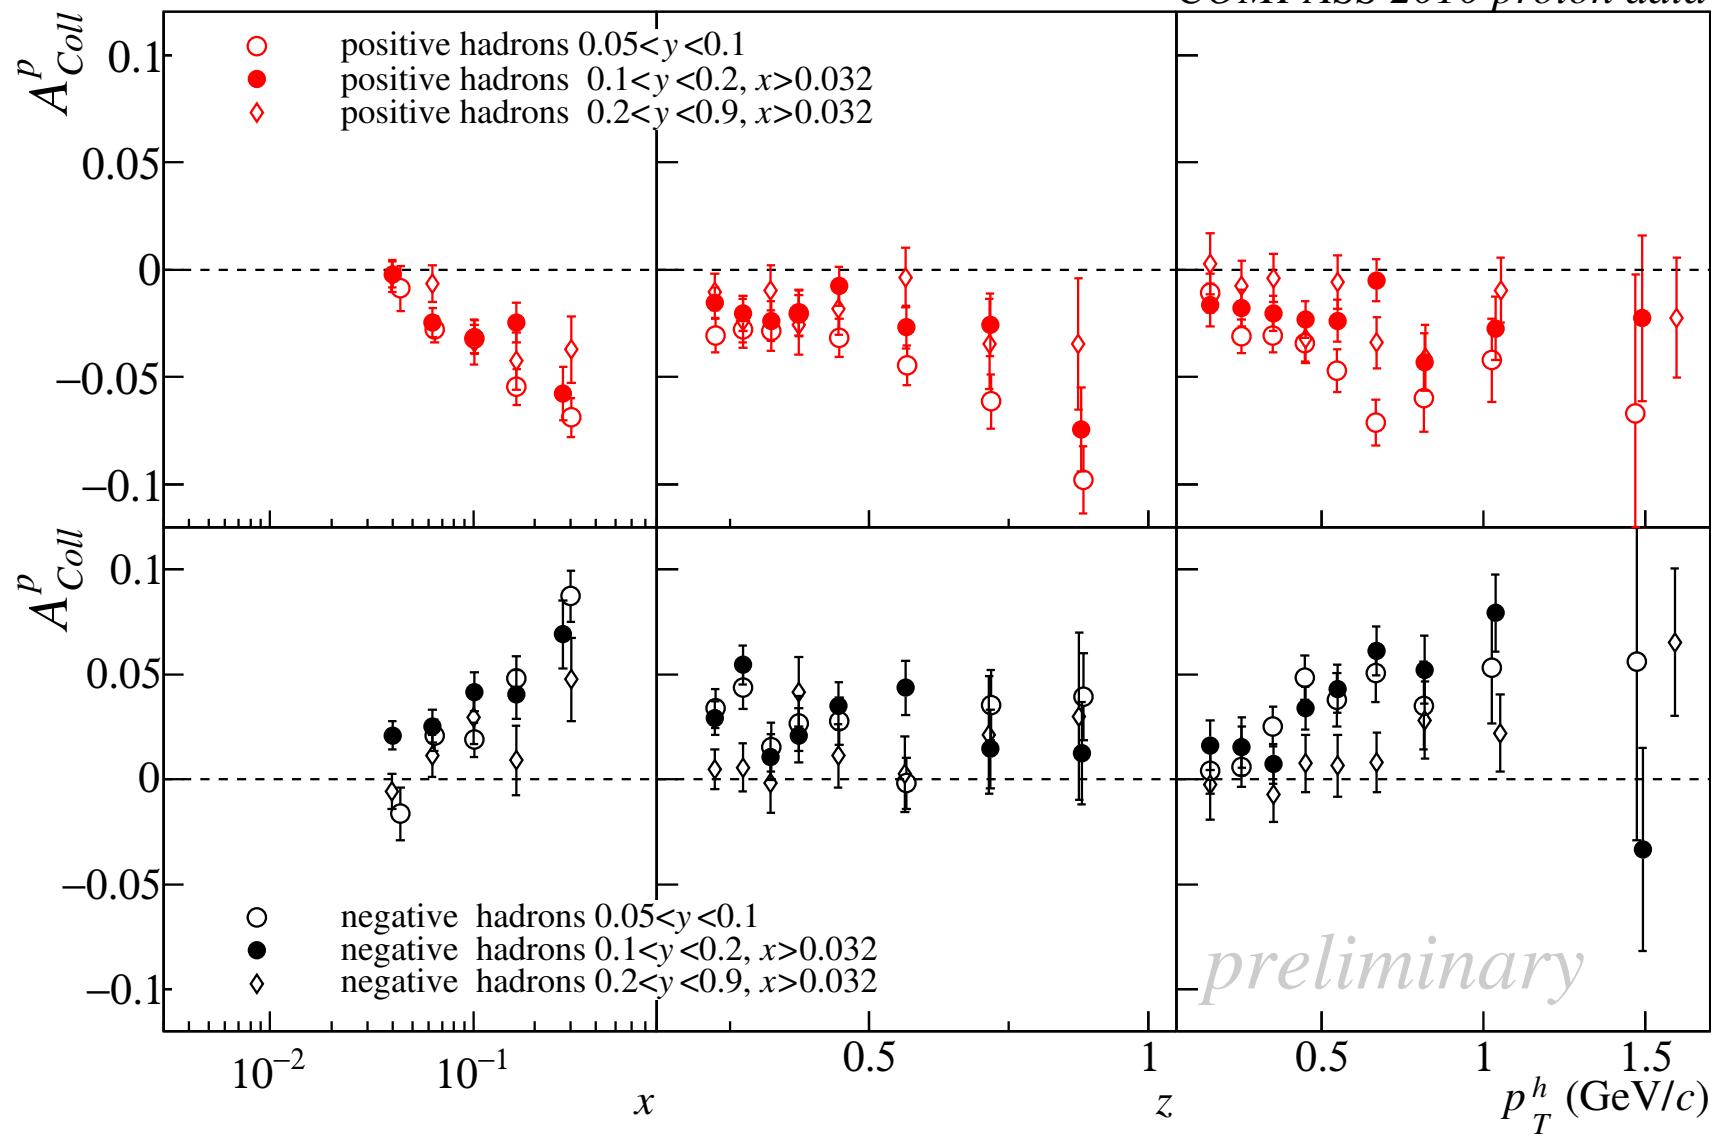

$0.1 < z < 0.2$

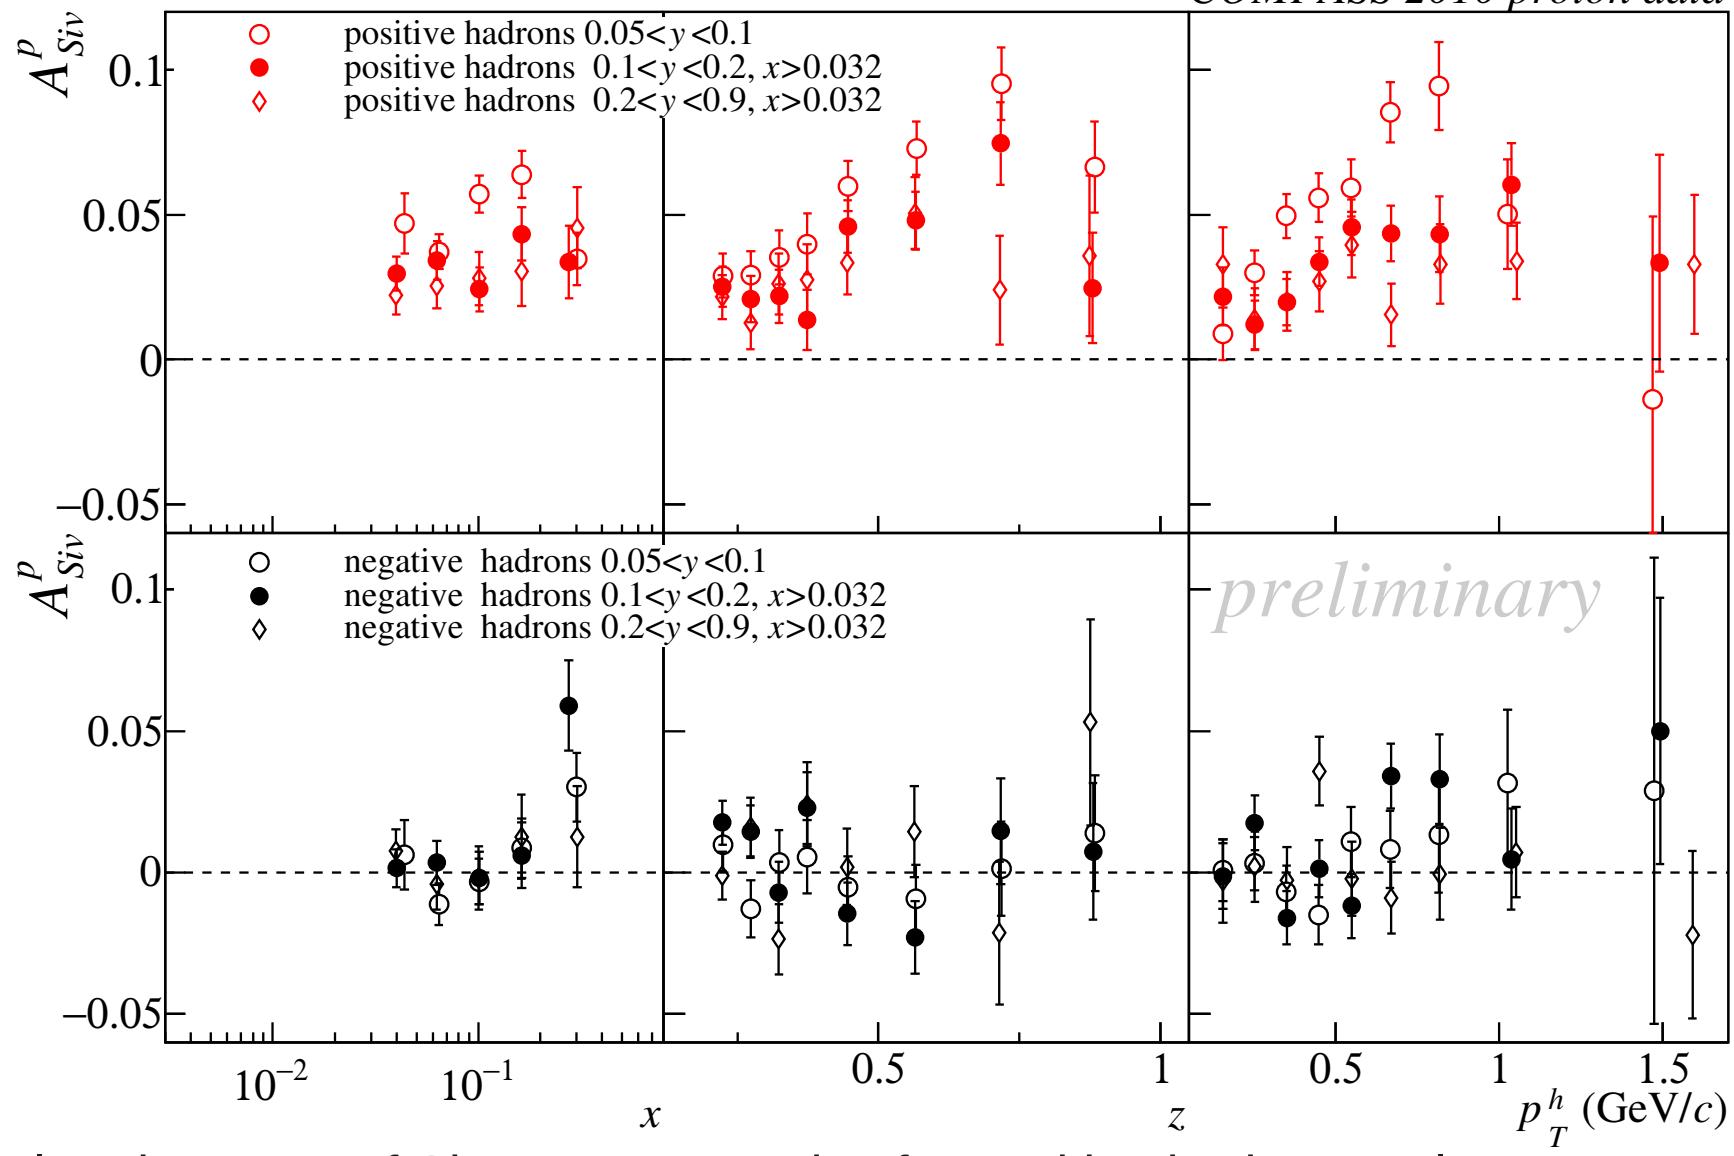

3 y ranges – Collins asymmetry

COMPASS 2010 proton data

3 y ranges – Sivers asymmetry

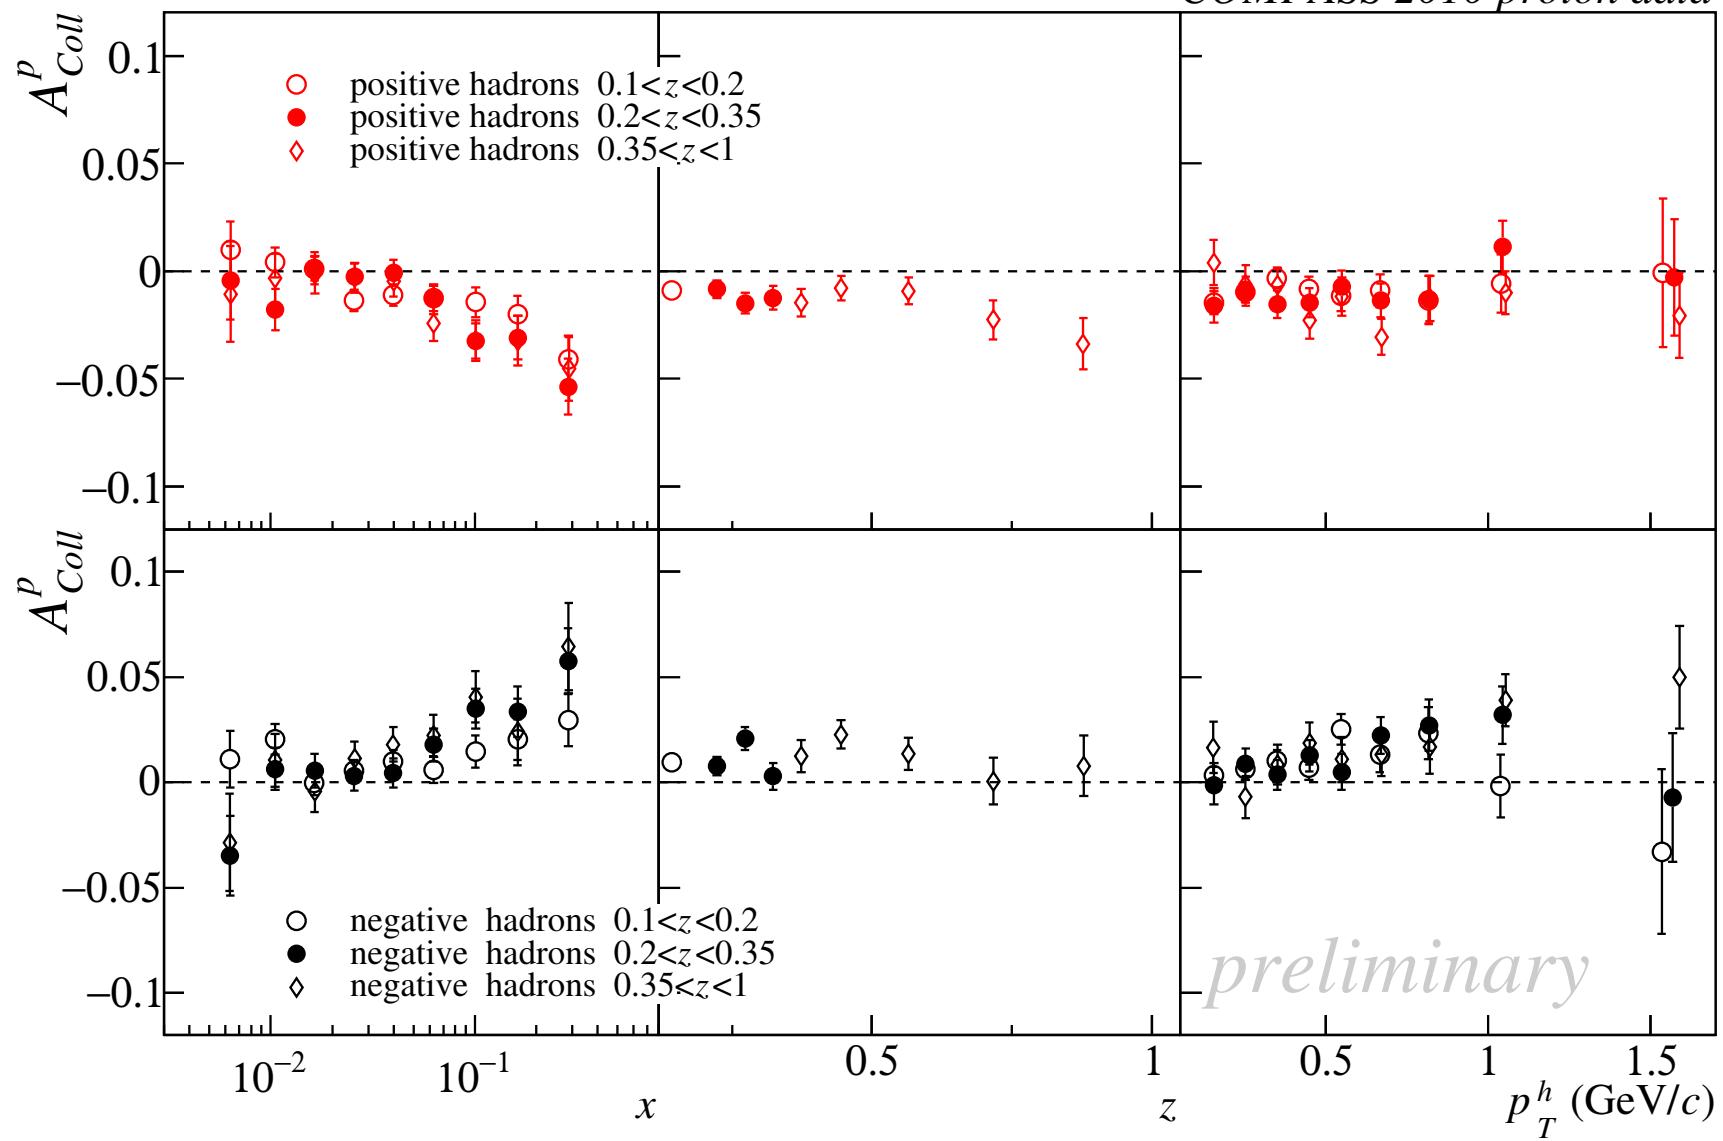

COMPASS 2010 proton data

clear increase of Sivers asymmetries for positive hadrons at low y

z in 3 ranges – Collins asymmetry

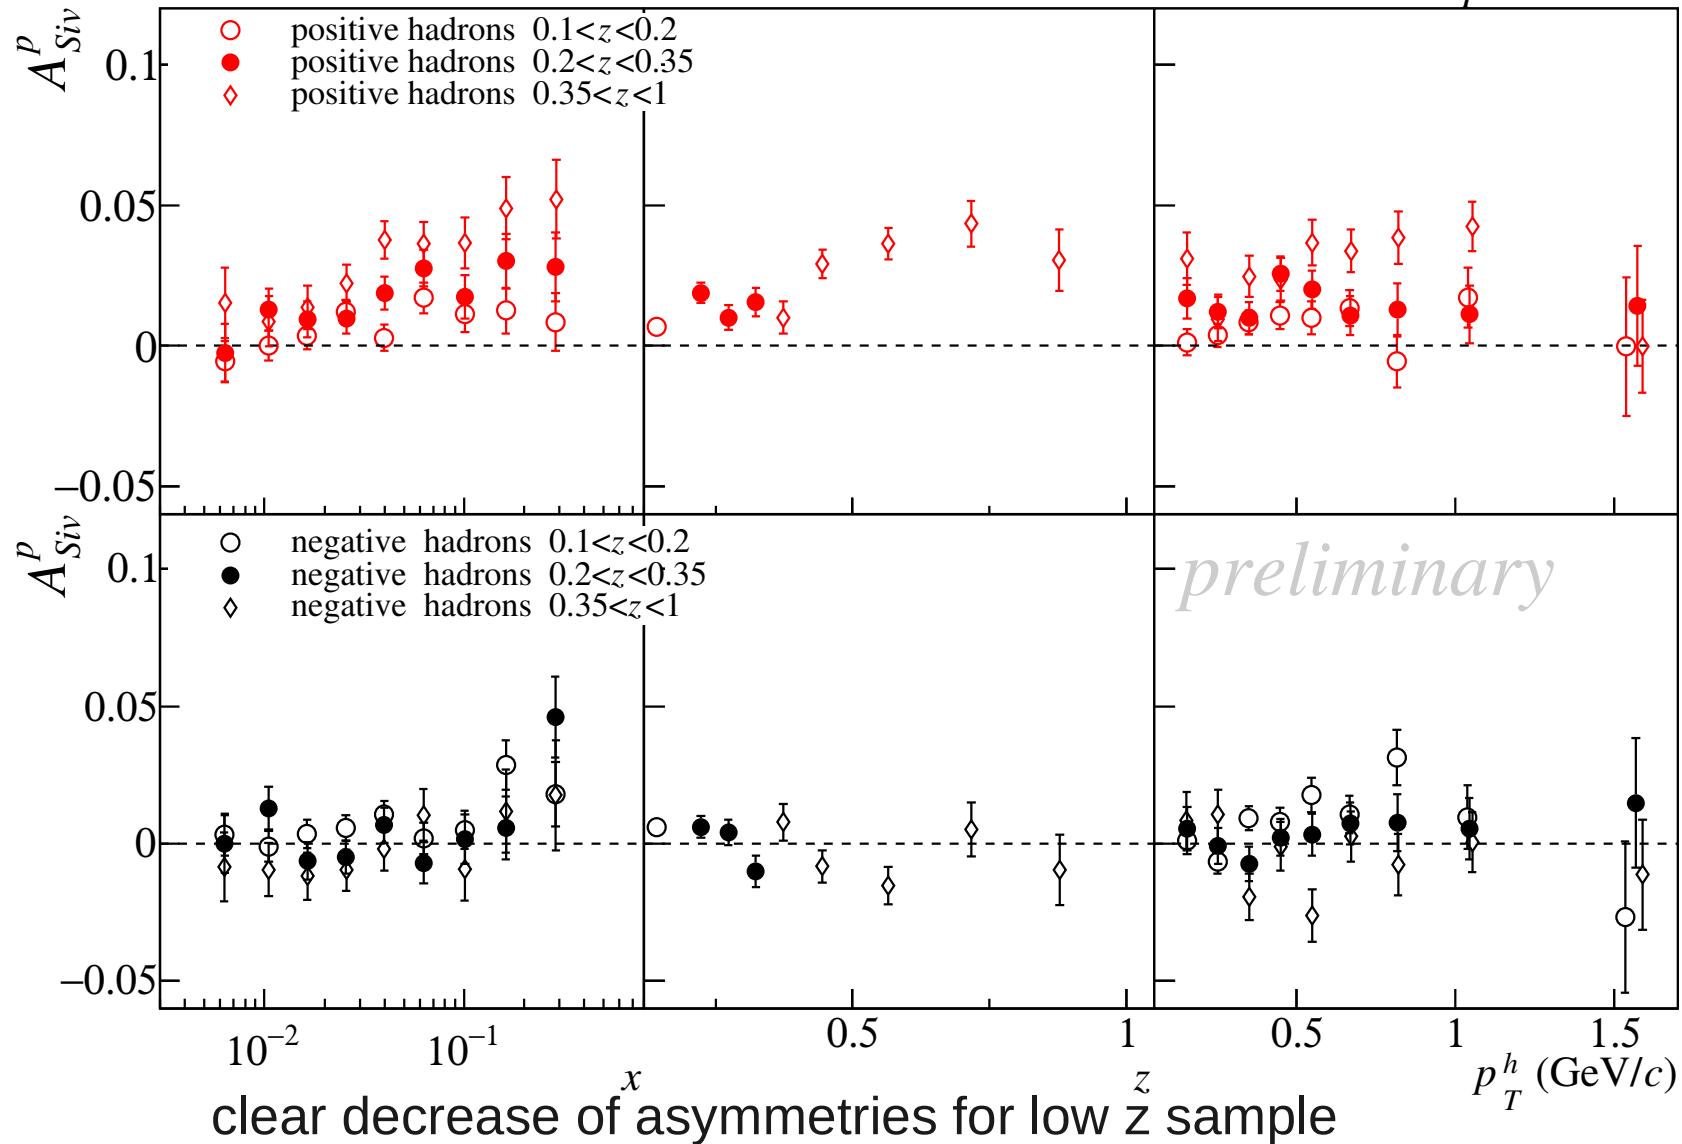

COMPASS 2010 proton data

small decrease of asymmetries for low z sample

z in 3 ranges – Sivers asymmetry

COMPASS 2010 proton data

Conclusions

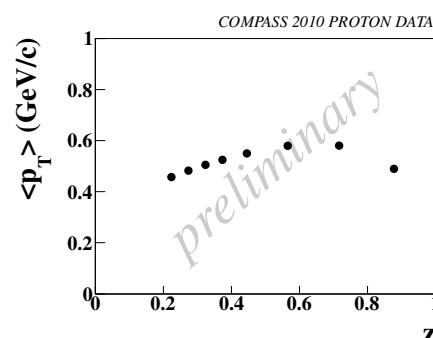

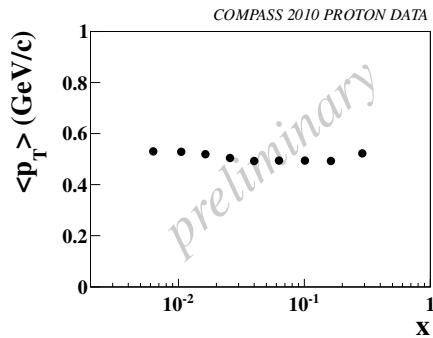

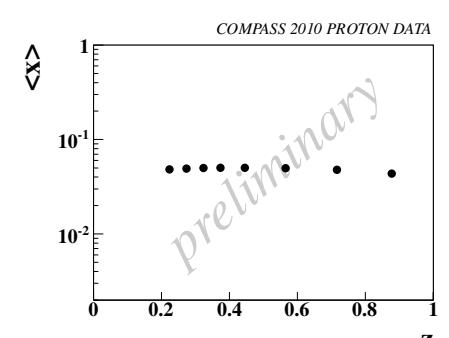

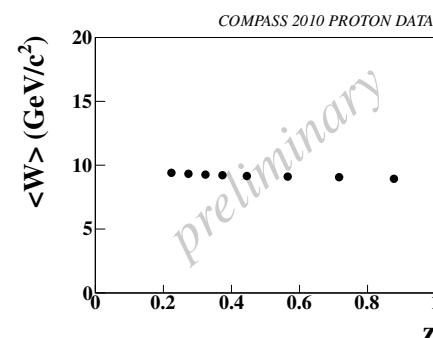

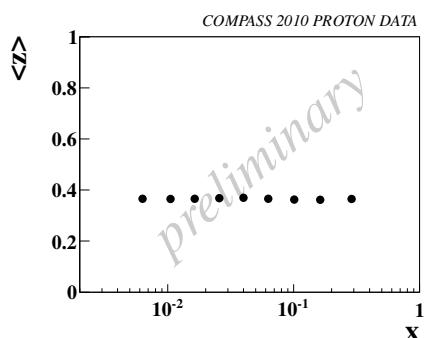

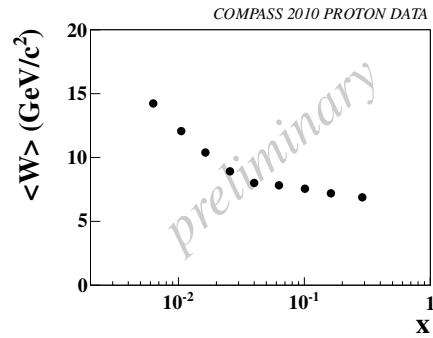

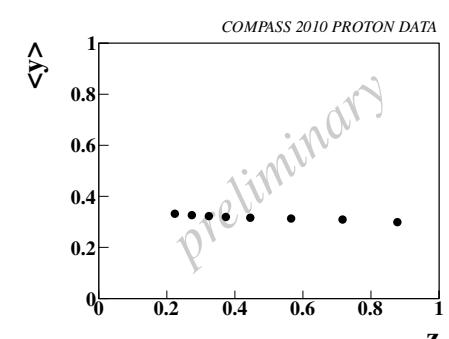

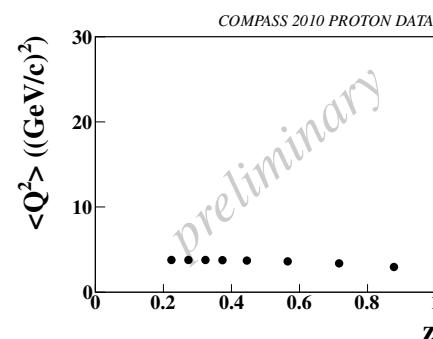

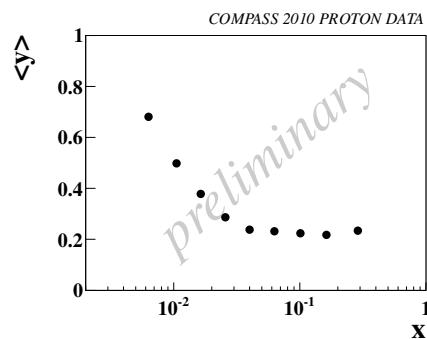

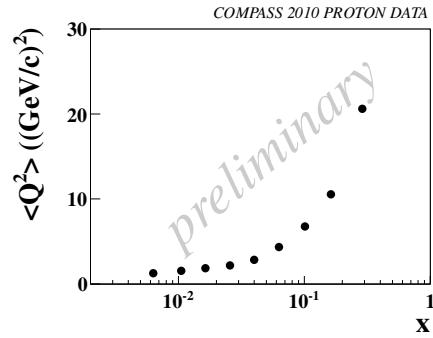

2010: one year of data taking on a transversely polarized proton target

- higher statistics and smaller systematical errors
- confirmation of 2007 results
- both Collins and Sivers asymmetries are different from zero
- new investigation of z and y dependence with interesting results

- next: asymmetries for identified hadrons (pions, kaons)
extraction of the other 6 asymmetries
